

# LEIA

## A reverse engineering form for Multi Agent Systems

François Gaillard and Yoann Kubera and  
Philippe Mathieu and Sébastien Picault

**SMAC team - LIFL - USTL**  
**UMR CNRS USTL 8022**  
**Villeneuve d'Ascq**

# Introduction

**What do we call reverse engineering for MAS ?**

## **Table of contents**

*I. SMAC team*

*II. IODA*

*III. LEIA*

*IV. An interesting result from LEIA*

*V. Conclusion*

# I - SMAC team

- ➔ software engineering for MAS
- ➔ Model of the behaviour of agents
- ➔ Implementation of the behaviour
- ➔ Evaluation of the behaviour of agents
- ➔ Design of experimentation platforms

**URL: [www.lifl.fr/SMAC](http://www.lifl.fr/SMAC)**

# II – IODA

Interaction Oriented Design of Agent simulation

**Methodology centered on Interactions**

[Mathieu Routier 01]

**Separation between what an agent can do and how he will do it**

# II - IODA

**How can an interaction occur ? [Kubera 08]**

## Declarative part

- Interaction
- Source/Target
- Distance Guard

## Procedural part

- Order in the evaluation of the interactions
- Selection process

## Interaction Matrix

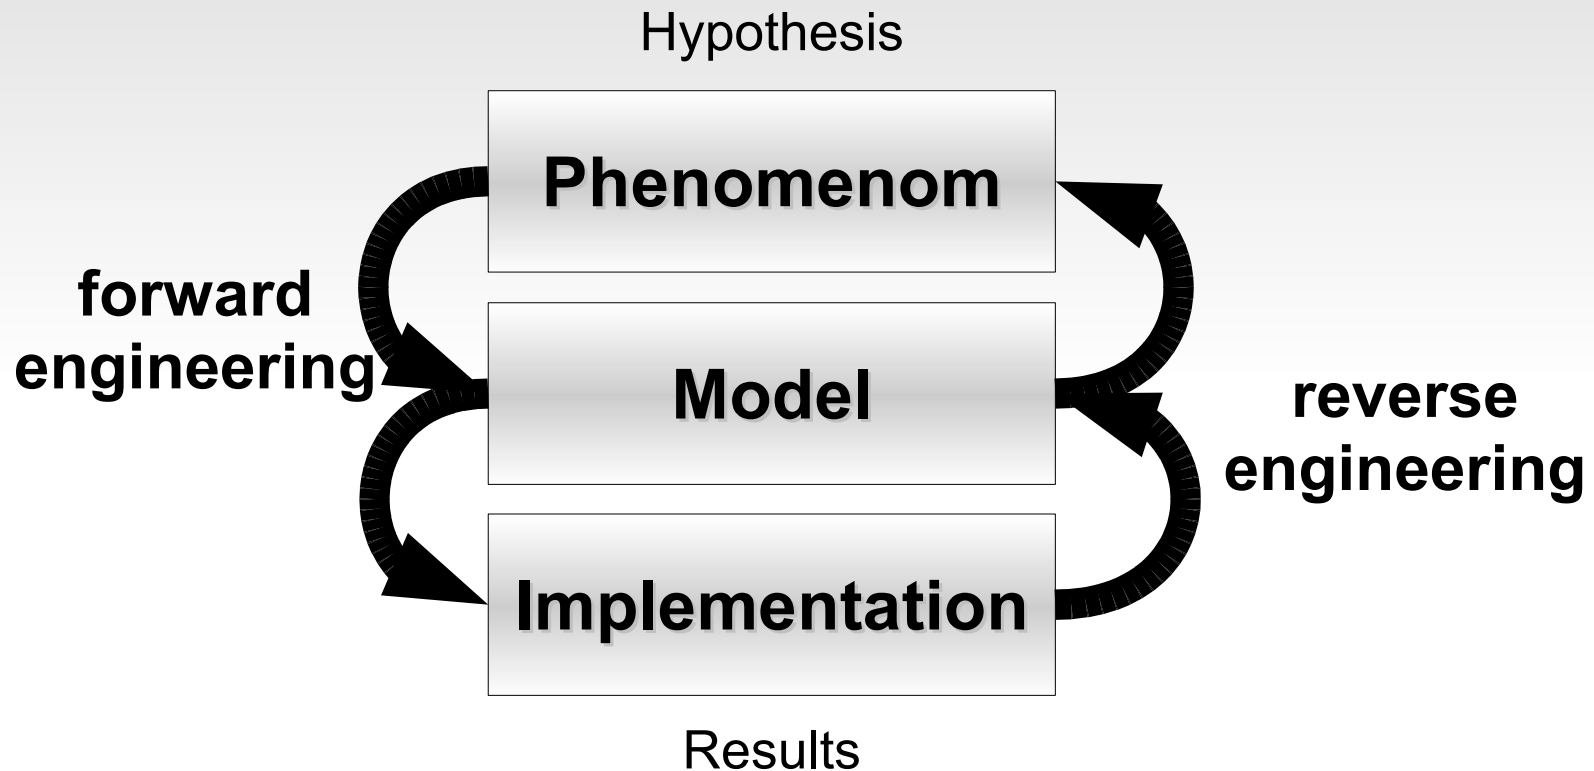

Source \ Target	Envir.	Red	Blue
Red		Follow 0 (4.0)	Run 2 (7.0)
Blue		Run 1 (5.0)	Follow 1 (2.0)

Interactions

Priority

Distance guard

# III – LEIA: the exploration of simulations as a reverse engineering form

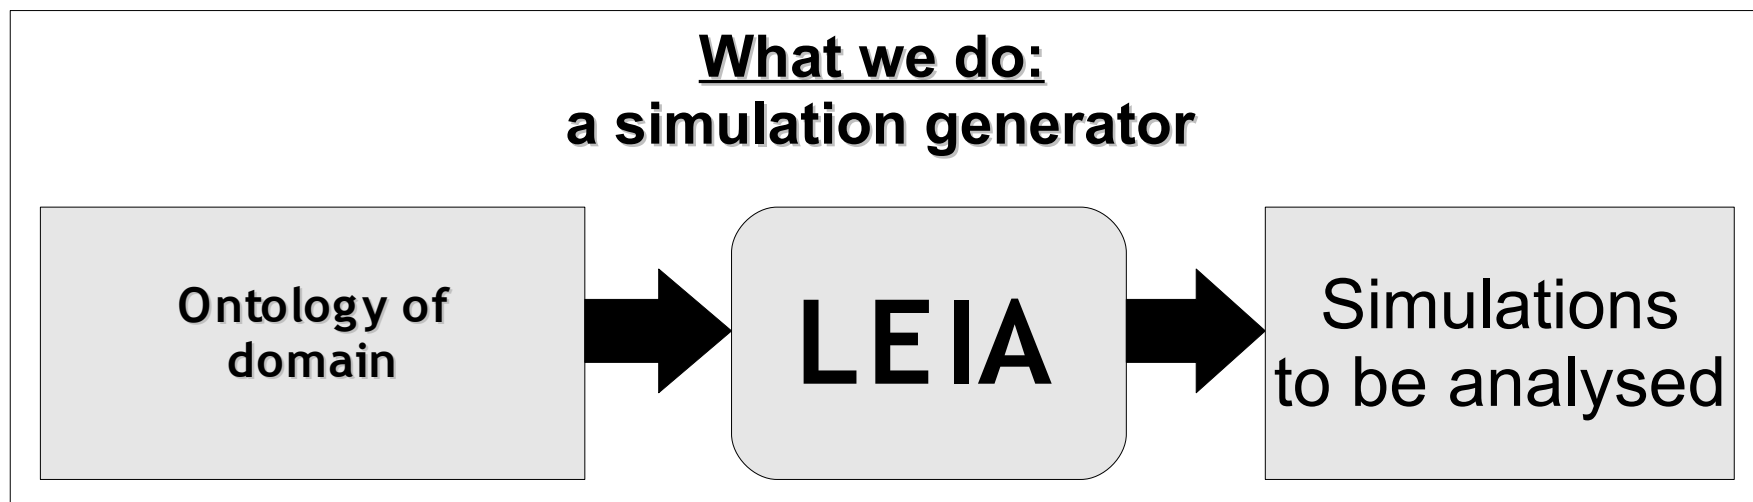

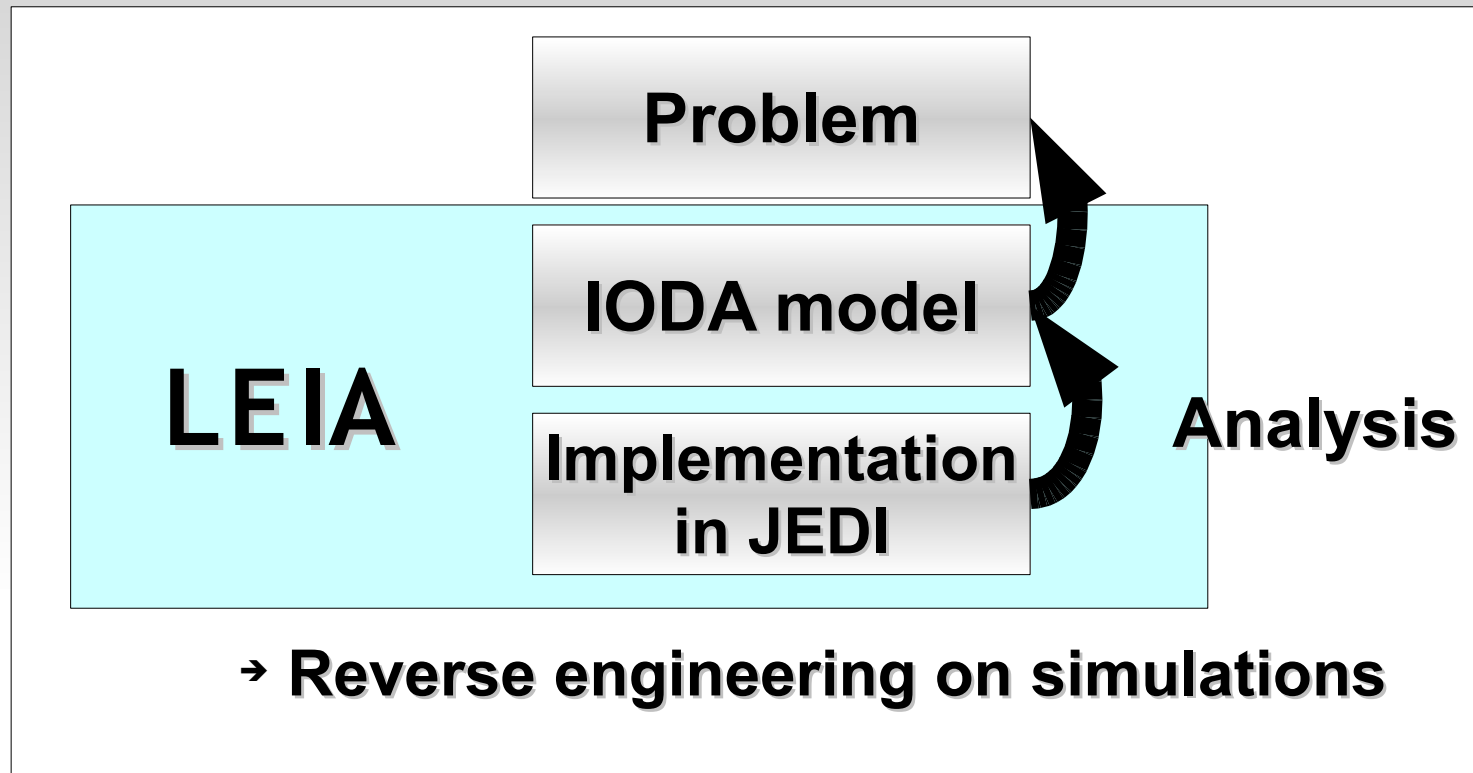

**Why doing reverse engineering ?**

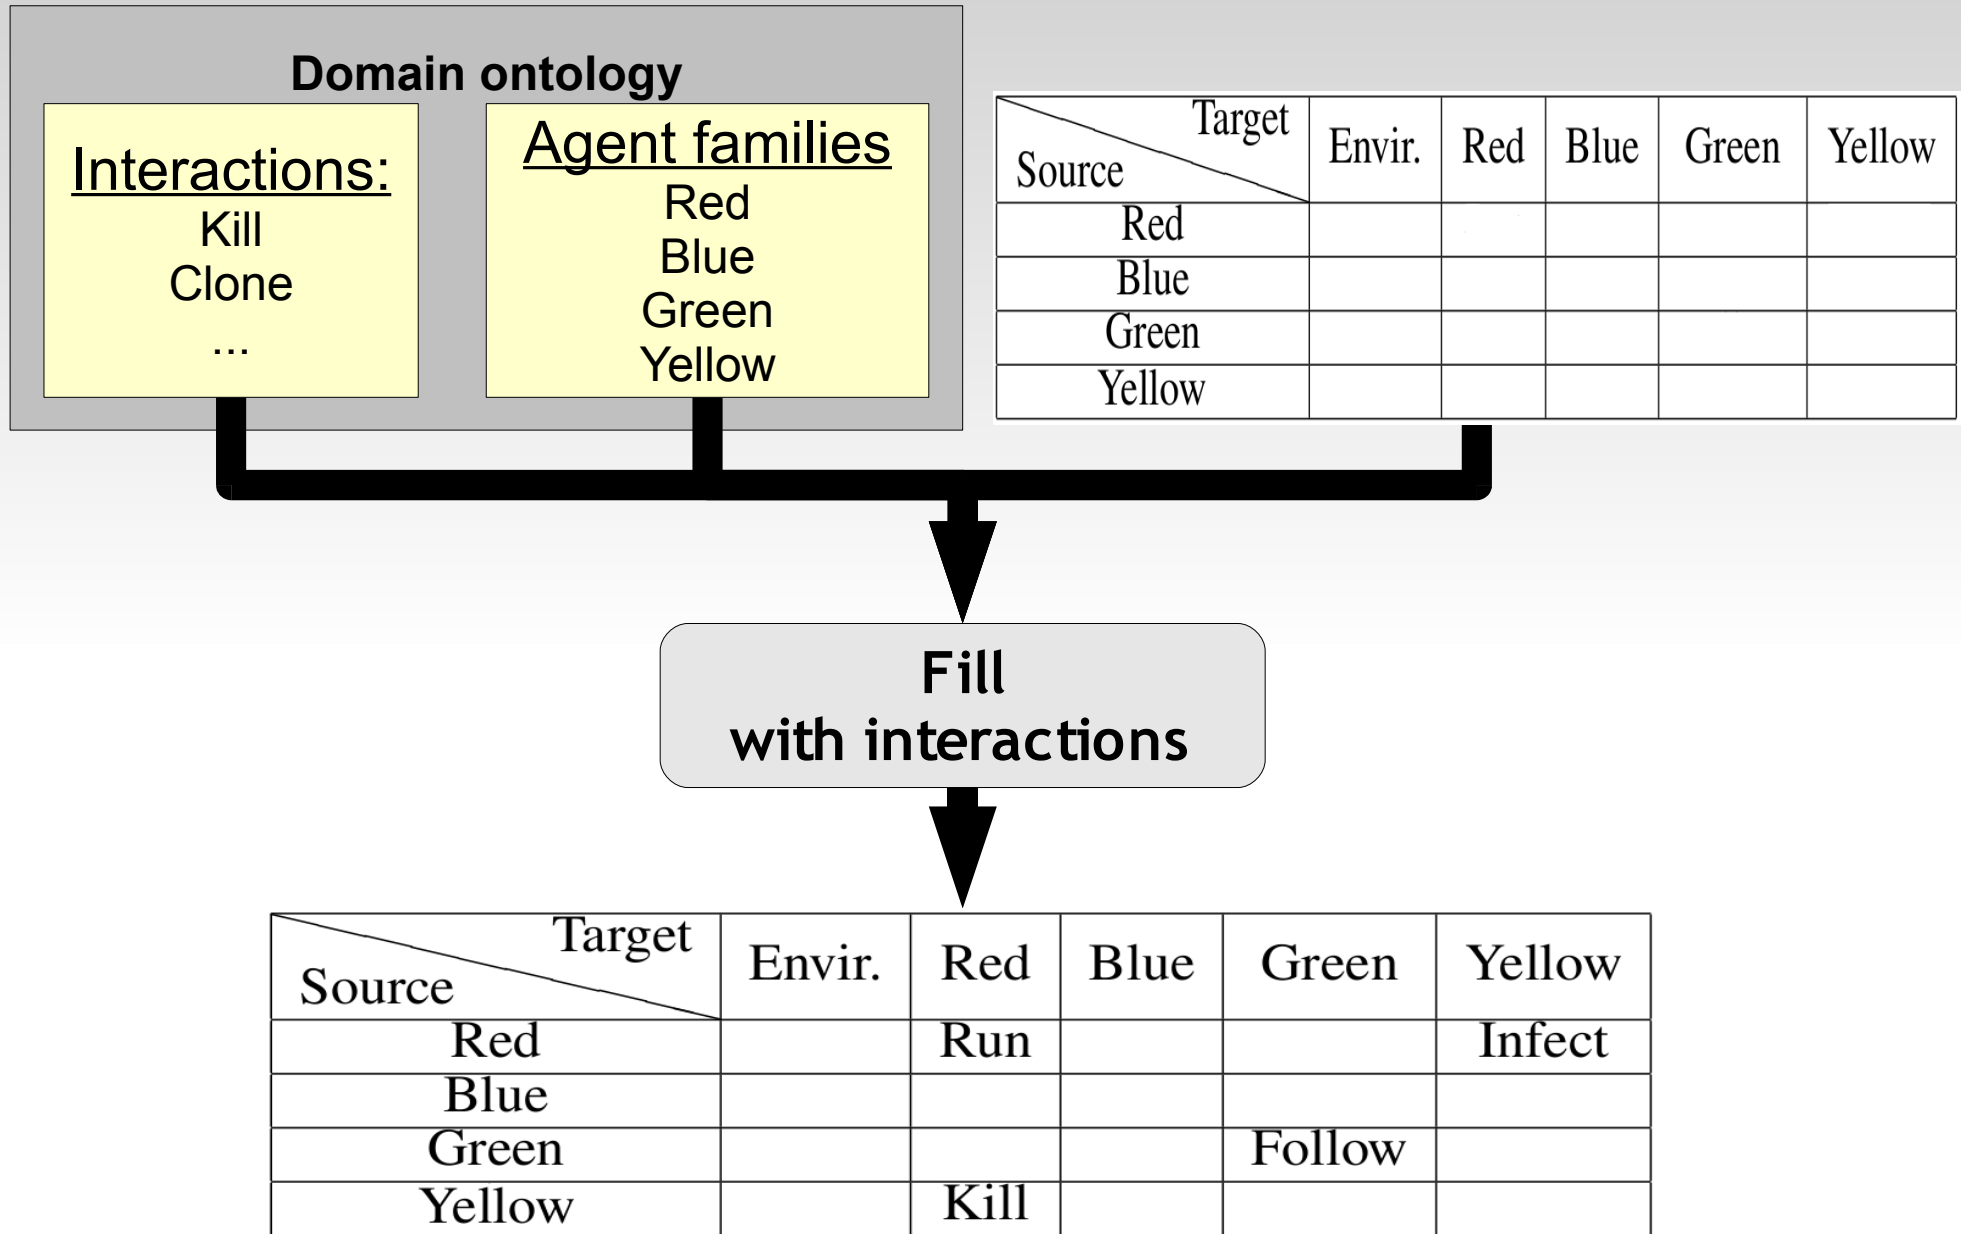

- Understanding the model
- A brain stimulator [Pachet 07]

# III - LEIA

**LEIA** lets you **E**xplore **I**nteractions for your **A**gents

# III - LEIA - Automatized building of model

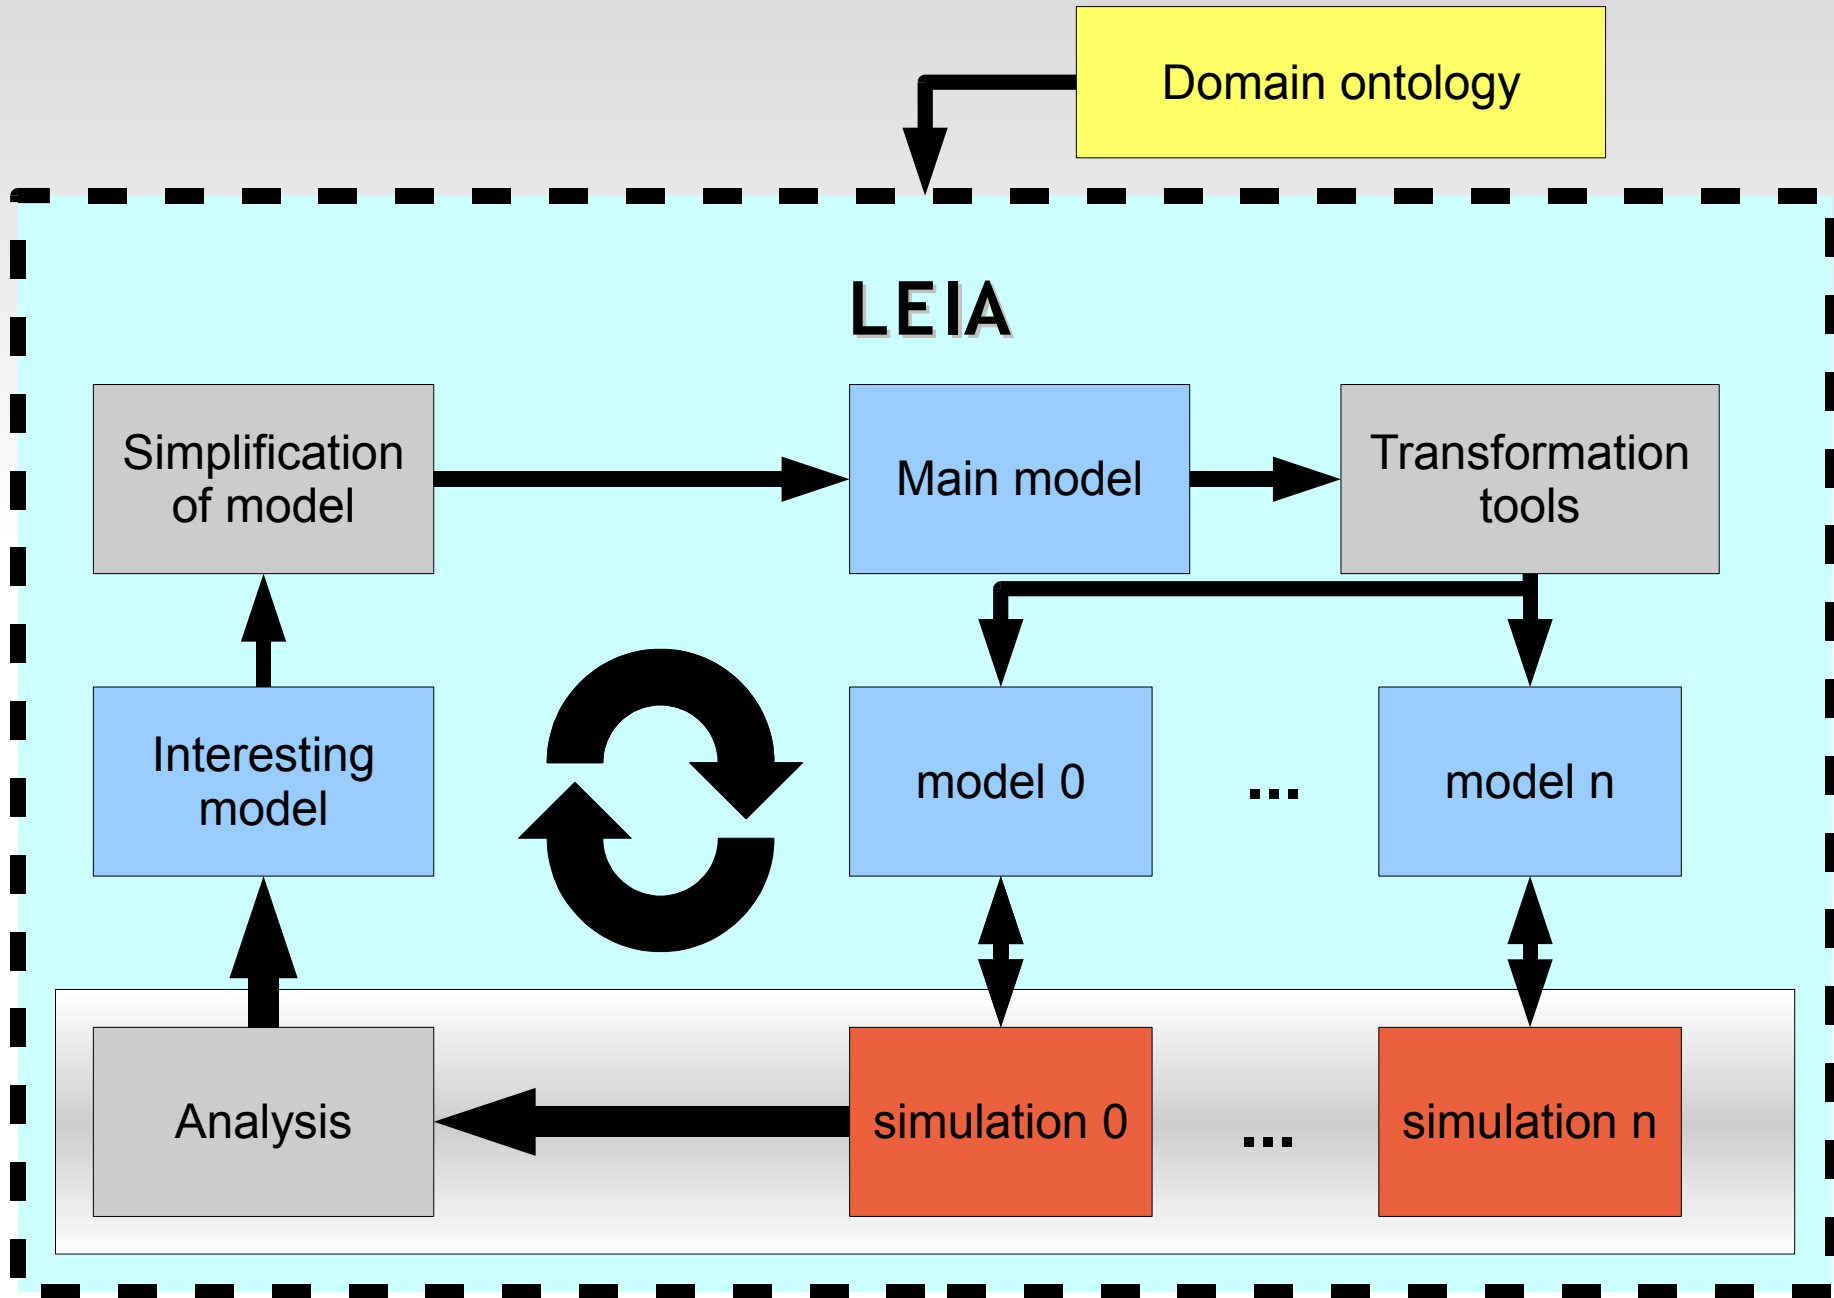

**We can do it thanks to IODA methodology !**

# III - LEIA - Let's explore the simulations space

Iterative construction of models by exploring the simulations space

# III - LEIA - our measurement tools

**Our aim:** analysing a simulation during the runtime

Activity of  
the agents

The evolution  
of the  
population

Density of  
population

Number of  
modification  
of the environment

Mix and Cohesion

## An example: a battle simulation

### Main points:

- Using the separation Interactions/Agents
  - Working with any JEDI simulation and any ontology of domain
  - Data from each families of agent and interactions

## III - LEIA - Let's explore the simulations space

### **Our aims:**

- Find new models
- Test the robustness of existing models
  - Test an ontology of domain

### **Our model transformation tools:**

- Test on the beginning number of agent
  - Add/Remove random interactions
- Modification of the distance guard/priority
- Derivation of an interesting model into new models
- Play with several interaction matrices at a time

# III - LEIA - Let's explore the simulations space

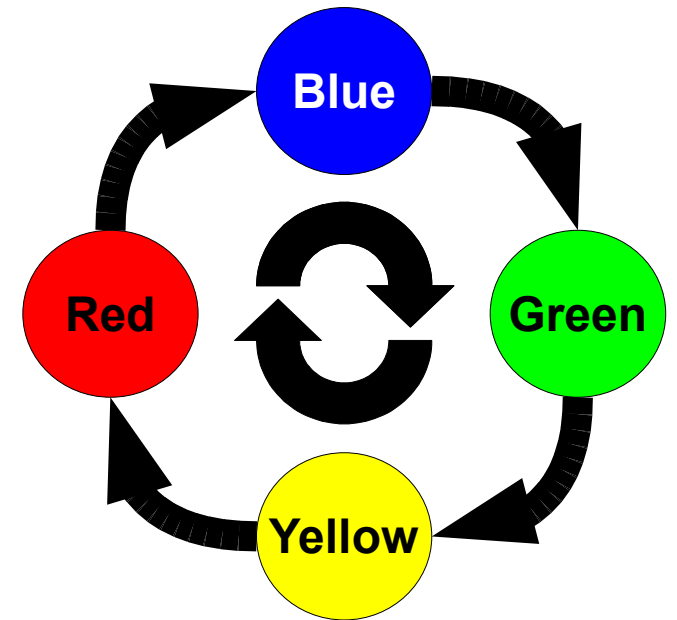

The screenshot displays the LEIA software interface with the following components:

- Window Title:** LEIA
- Navigation Tabs:** Configuration, Parameters, Simulations (selected)
- Sub-Tabs:** Model, Model modifying, Model testing (selected), Model mixing
- Context Menu (under Model testing):**
  - Add/Remove assignation
  - Priority/limit distance of an assignation
  - Family/Population (highlighted)
  - Source/Target assignation
- Simulation Results (Heatmaps):**
  - Top-left: score = 23.0
  - Top-right: score = 18.0
  - Bottom-left: score = 19.0
  - Bottom-right: score = 30.0
- Control Panel:** A progress bar with a play button icon, and buttons for Unpause and Restart.
- Footer:** Copyright © 2008 SMAC - <http://www.lifl.fr/SMAC>

# IV – An interesting result from LEIA

## an infection model

Source \ Target	Envir.	Red	Blue	Green	Yellow
Red			Infect		
Blue				Infect	
Green					Infect
Yellow		Infect			

## Excitable medium

Cyclical cellular automaton  
[Griffeath 93]

Belousov-Zhabotinsky reaction  
[Belousov 59, Zhabotinsky 50]

# V – Conclusion

- A simulation generator without any code generation
- Made thanks to **IODA** methodology
- The **user is implied** in the iterative process of exploration of the simulations space in order to create new models
- guide lines to improve simulations following several metrics
- **Reverse engineering** by analysis of simulations

- Take place in a whole framework from the conception of interactions to their implementations using IODA, JEDI, JEDI Builder and now LEIA
- **Exploration** of an ontology of domain with genetic algorithm

**Let's visit [www.lifl.fr/SMAC/LEIA/](http://www.lifl.fr/SMAC/LEIA/)**
