Agenda

- Introduction
- Product and Service Lifecycle Management
- High-level PLM/SLM interaction patterns
- Interactions on operational level
- Approach for integration of PLM and SLM
- Conclusions and Outlook

Introduction

- For PSS, both product and service lifecycle must be managed, interact and exchange information
- When PLM approaches consider services, they are mostly treated as an addition to the product
- Highly integrated PSS require a systematic bi-directional coordination and interaction between the product and service lifecycle
- Feedback loops between PLM and SLM need to be established, in spite of varying time spans
- *Interaction mechanisms and patterns are analyzed based on expert interviews and three use cases*

PLM and SLM

[Stark 2011]
 [Freitag et al. 2013]

Case A: SLM follows PLM

New service development is dependent on product lifecycle

IBARMIA.

- Focus on product innovation and customization
- Intelligent Maintenance is triggered by phases or changes in PLM
- Service ideation and evolution have low relevance

Case B: PLM follows SLM

New product development is dependent on service lifecycle

75 £

1 FABRIC 2 DESIGN 3 MONOGRAM 4 SIZING 5 EXTRA

REVIEW

Choose a fabric
 Choose your shirt's fabric using the drop-down menu. Then click on a fabric swatch to see it on the shirt designer.

Collection & Price:
 All

Colour:
 All

WASH & GO, NON-IRON, DRY & FLY
 Rius Vima Lane Lane

Business Shirt
 Fundamentals Helve 1
 Helve 1 is a Easy-Iron.Easy-Care, 100% Cotton fabric from the Fundamentals collection. This Stripe Poplin fabric has a White & more colour.

Density: 100 / 2 * 100 / 2
 Weight: 105 g/m²

Go to DESIGN

ONLINE HELP

- Focus on online configuration and sizing of shirts
- Shirt production is triggered by phases or changes in SLM
- Manufacturing is outsourced to third party companies

Case C: PLM aligned with SLM

New service and new product lifecycles with reciprocal interconnections

- Carefree Washing PSS
- Product and Service rely on each other
- PLM and SLM are more or less in parallel
- Interactions take place when deemed necessary

Zigbee module & connectivity

Interactive display (messages)

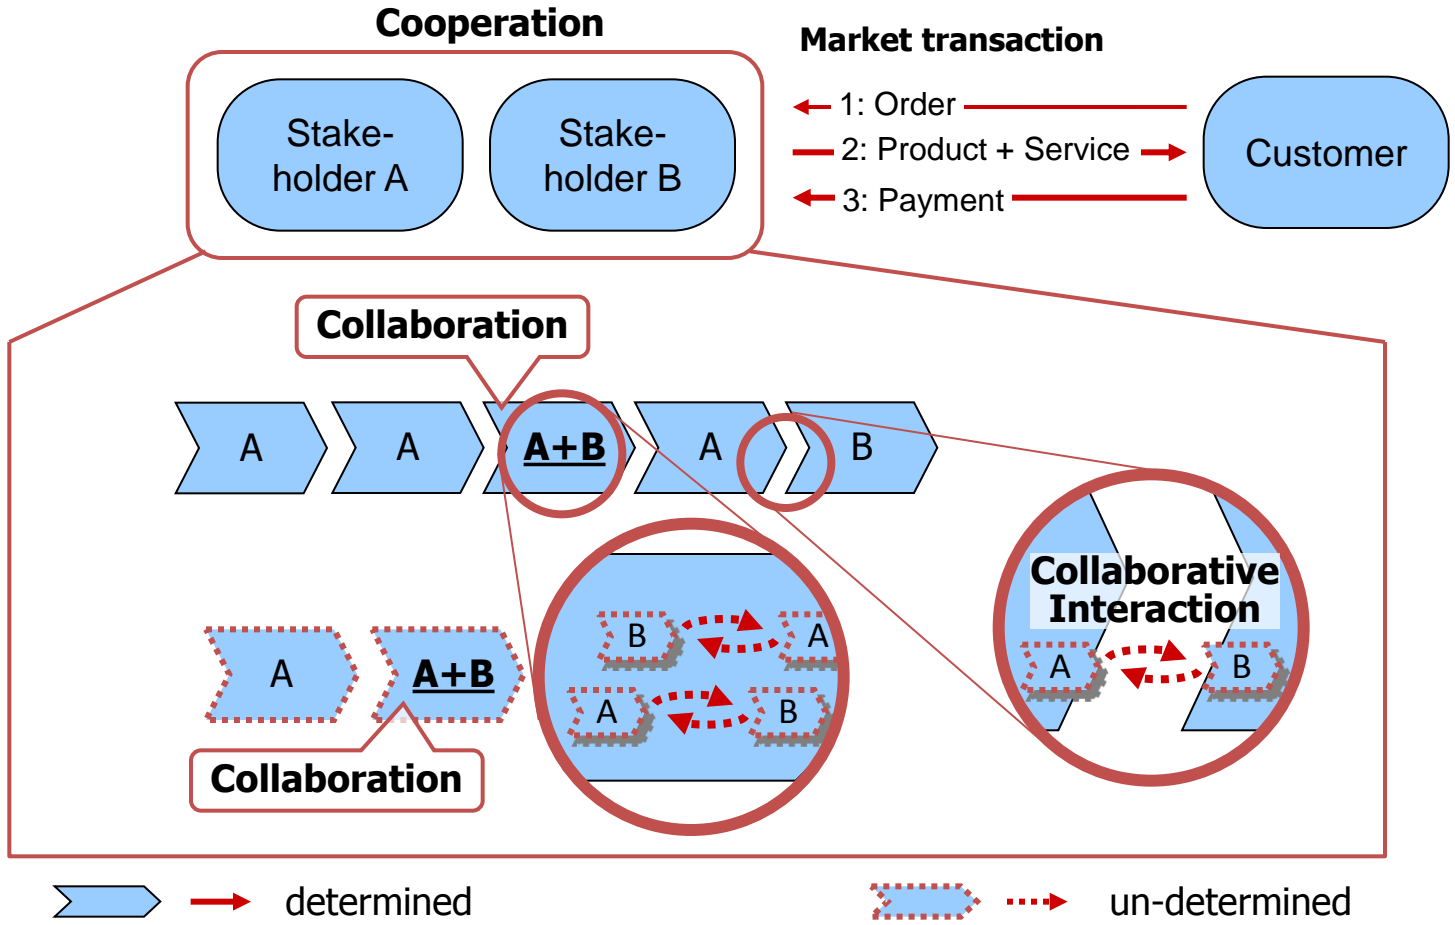

New sensors (water hardness, anti-flood, ...)

New SW and main board

PLM integrated with SLM

Alternative D: Fully integrated new service and product development and lifecycles

PLM & SLM

Types of Interaction

- Information Exchange
- Coordination
- Negotiation
- Conflict solving

Information Exchange

Partner A

Partner B

- Sharing ideas
- Stakeholder requirements
- Solution specification
- Usage data
- ...

This means for PSS:

- Definition of interfaces and information that has to be exchanged between the stakeholders along the lifecycle
- Participation of stakeholders from the product and service area in the PSS ideation process
- Common requirements elicitation and management for specification product and service components
- Feedback loops from product usage to service design and vice versa

Coordination

- **Align strategy**
- **Adjust plans**
- **Synchronize activities**
- ...

This means for PSS:

- Coordination is in particular relevant during the development process of the PSS
- A common vision of the PSS has to be established among the stakeholders from the product and service area
- Project management should be implemented across domains and inter-organisational

Negotiation

- **Decision making**
- **Agreement on common objectives**
- ...

This means for PSS:

- Trade-off between the optimal solution for the product and the optimal solution for the service
- Example: Frequency of measuring data => service expects higher frequency, machine offers lower frequency.
- Agreement on non-technical issues like profit sharing etc.

Conflict Solving

Partner A

Partner B

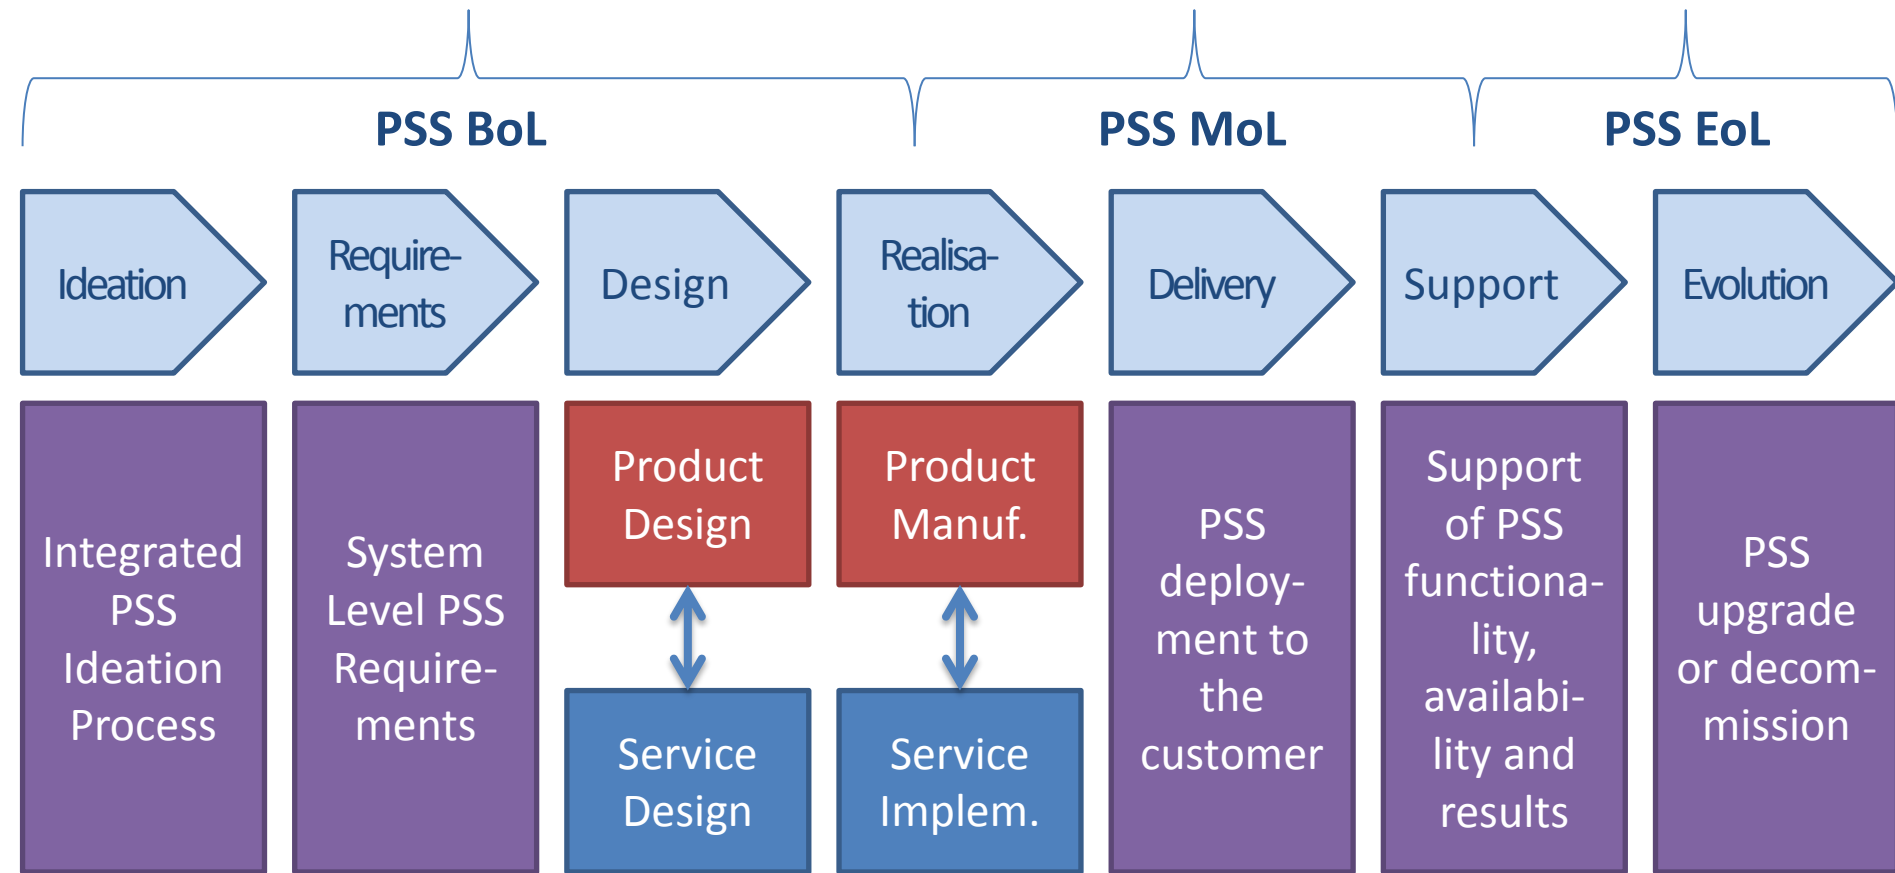

- Identification of conflicts
- Development of solutions
- Agreement on standards
- ...

This means for PSS:

- Strongly connected to negotiation
- Ensure that the service could really work with the product.
- Example: If the service requires a certain data exchange standard, and the product only supports another standard.
- Financial conflicts, competition among stakeholders etc.

P-SLM Vision

Conclusions and Outlook

- PLM/SLM integration is present in different degrees in the analyzed use cases
- Four temporal interaction patterns could be found between PLM and SLM
- Full PLM/SLM integration requires collaborative processes of information exchange, coordination, negotiation and conflict solving
- *Further research will describe the P-SLM phases and the underlying collaborative processes in detail*
- *Final objective is the development of a symbiotic Product-Service Lifecycle Model*

Thank you for listening!

This work has been partly funded by the European Commission through the FoF Projects **MSEE** (No. 284860) and **PSYMBIOSYS** (No. 636804). The authors wish to acknowledge the Commission and all the project partners for their contribution.

BIBA - Bremer Institut für Produktion und Logistik GmbH

- BIBA is an engineering research institute at the University of Bremen and does research in the field of production and logistics.
- BIBA was founded in 1981 as one of the first affiliated institutes of the University of Bremen.
- BIBA researches and develops technical and organisational solutions and implements them in practice-oriented businesses.
- The staff at BIBA comes primarily from production engineering, industrial engineering, computer science, electrical engineering and other related scientific disciplines.
