PRO-VE 2010**

**Towards an Environmental Management
Approach for Collaborative Networks**

Ovidiu Noran

11/10/2010

Economic sustainability is paramount to the enduring business – but history has shown there are other essential factors that can ensure success or bring downfall.

Thus, the bottom line needing to be met is (at least) *triple* (Elkington, 1998):

- 1) economic
- 2) environmental
- 3) social

I.e. a business cannot be successful in the long term unless it also treats its environment and its workers properly...

The focus of this work is on the proper integration of environmental management within all aspects of the business.

Environmental Management (EM) state of the art: all is not well

- EM was seen as necessary – mandated -> for image -> really useful
- CNO participants approach EM at different detail levels / pace
- no EM effort coordination / coherence -> loss of aggregate capabilities
- EM reporting hard to use: language, format, aggregation level, ...

What most companies / networks do (for themselves and VOs):

- Implement an Environmental Management System (EMS): alone, it does not trigger cultural change; current regulation is weak...
- Attempt to use an EM framework and environmental assessment and reporting frameworks: unfortunately the essential life cycle coverage is limited mostly to the products – what about the company, its information system (IS), the EM setup project(s), the EMS...?

What also appears to be missing is the *strategic integration* of EM in the VO / CN participants... however this implies that other business components (e.g. its IS) must (at least partially) also change. The EM project becomes a complex endeavour...

Some of the major concerns:

- consistent EM approach, inside and between CN participants
- acceptance of EM artefacts by the target audience (leading to real and *permanent* changes in the way people do things),
- appropriate resources and authority for the EM project, consideration of all relevant entities involved and their life cycle phases.

It is hereby proposed that since Enterprise Architecture (EA) has been effectively addressing such concerns in the past, it could also help integrate environmental aspects in the management and operation of the business.

But... what is EA?

Many definitions exist – we propose for this context:

“a change management approach bridging management and engineering best-practice”

So... how can EA solve the problem?

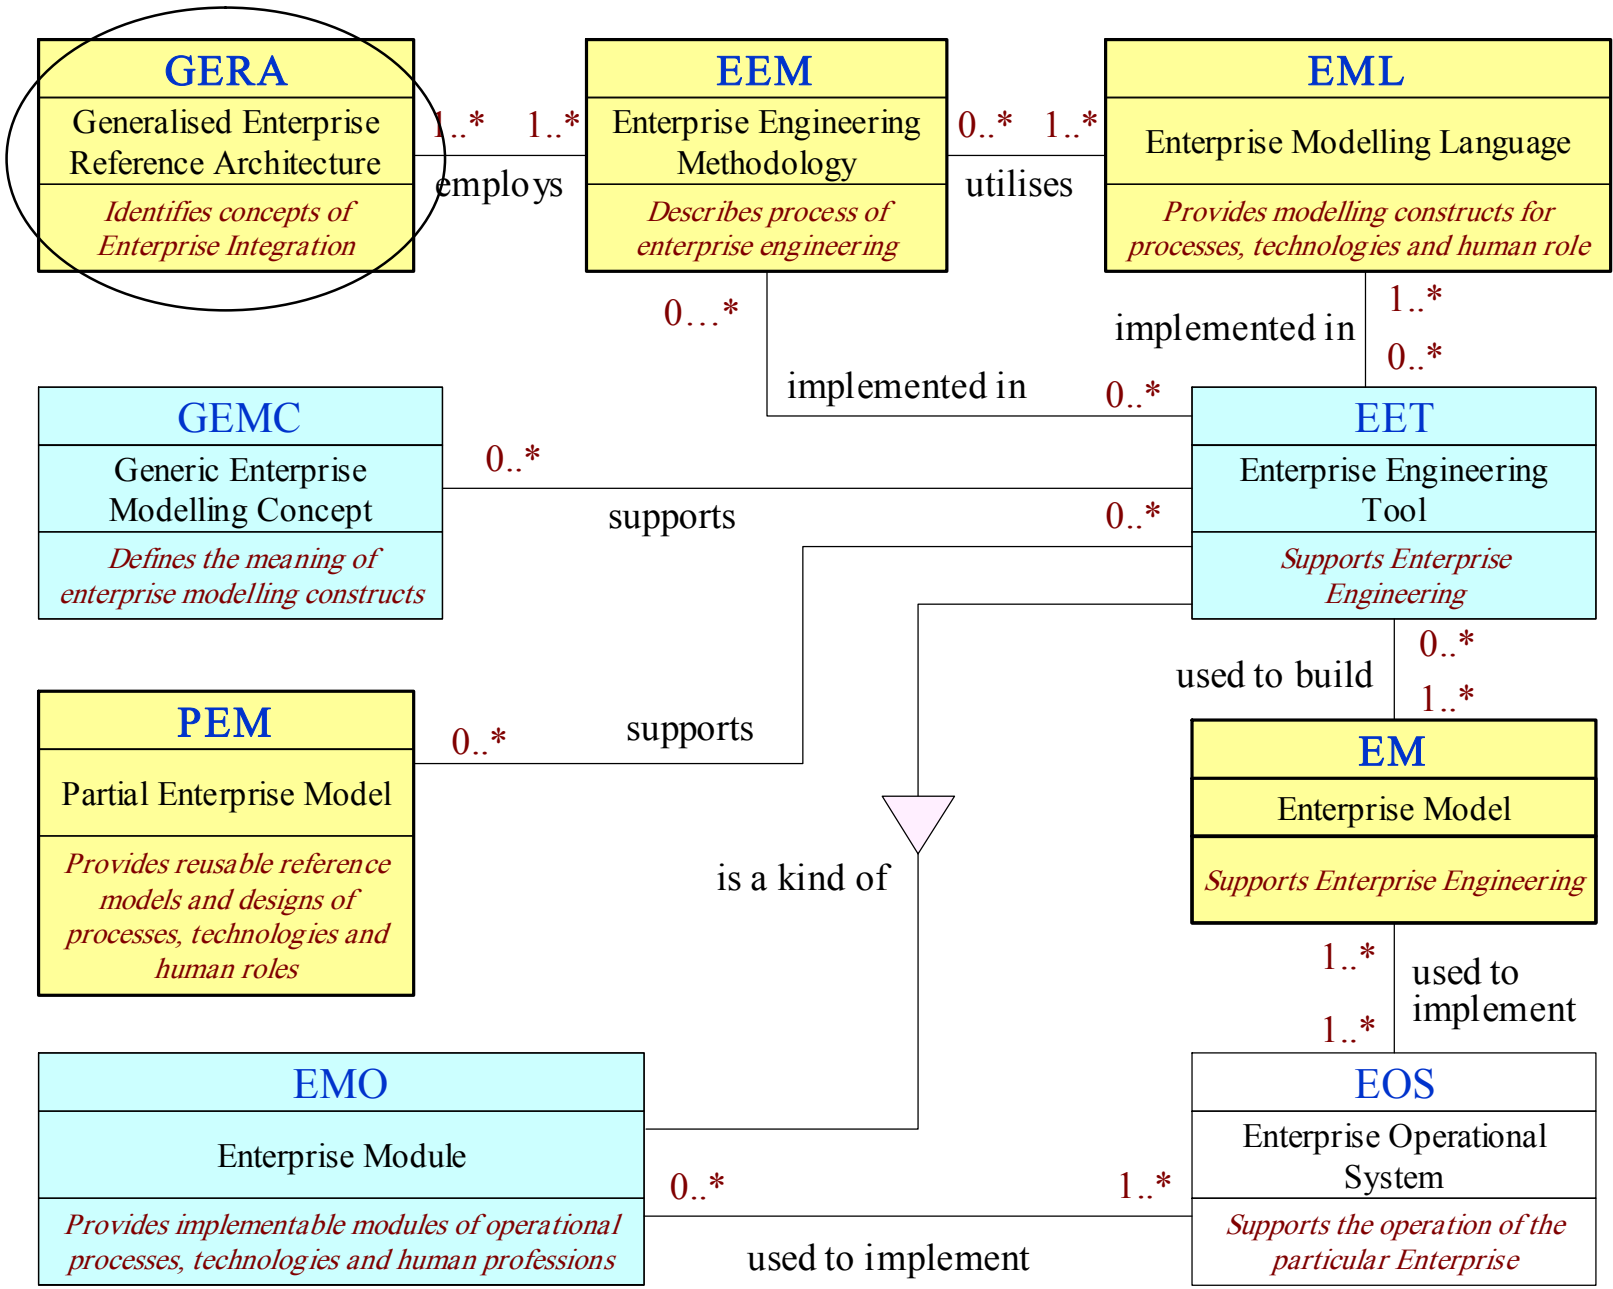

The following tries to give an example...

It presents the use of typical EA artefacts - i.e. an Architecture Framework and a Meta-methodology for EA projects - in the creation and operation of an EMS, so as to ensure that all relevant aspects are tackled in a life cycle context, for all relevant entities involved.

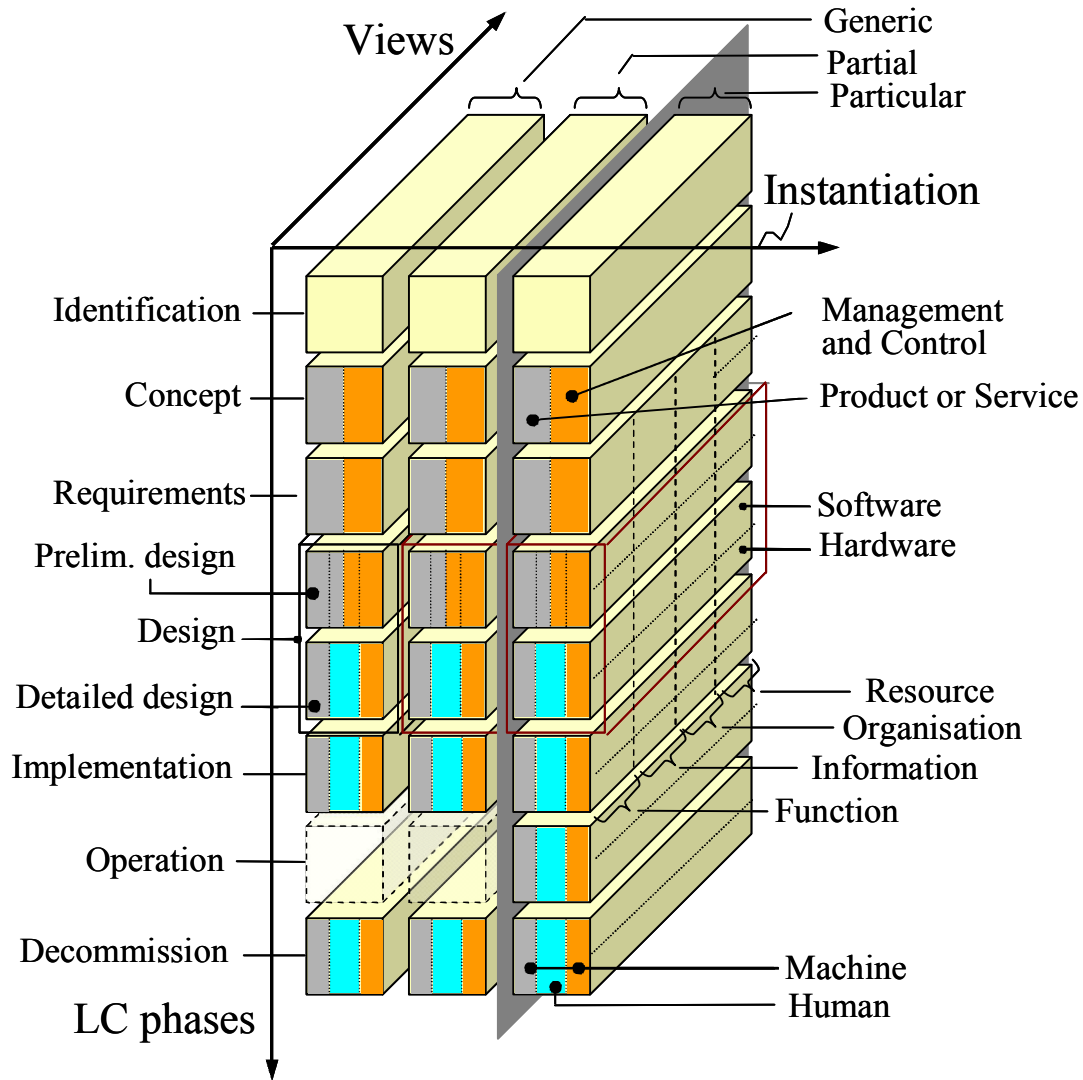

(Previous work tested their use in VO formation and operation; here they are employed to solve the (new) issue of the century:
Environmental Sustainability via proper management / practices)

Initially developed at strategic level, this approach can be naturally detailed to operational /real time level once the basics are right.

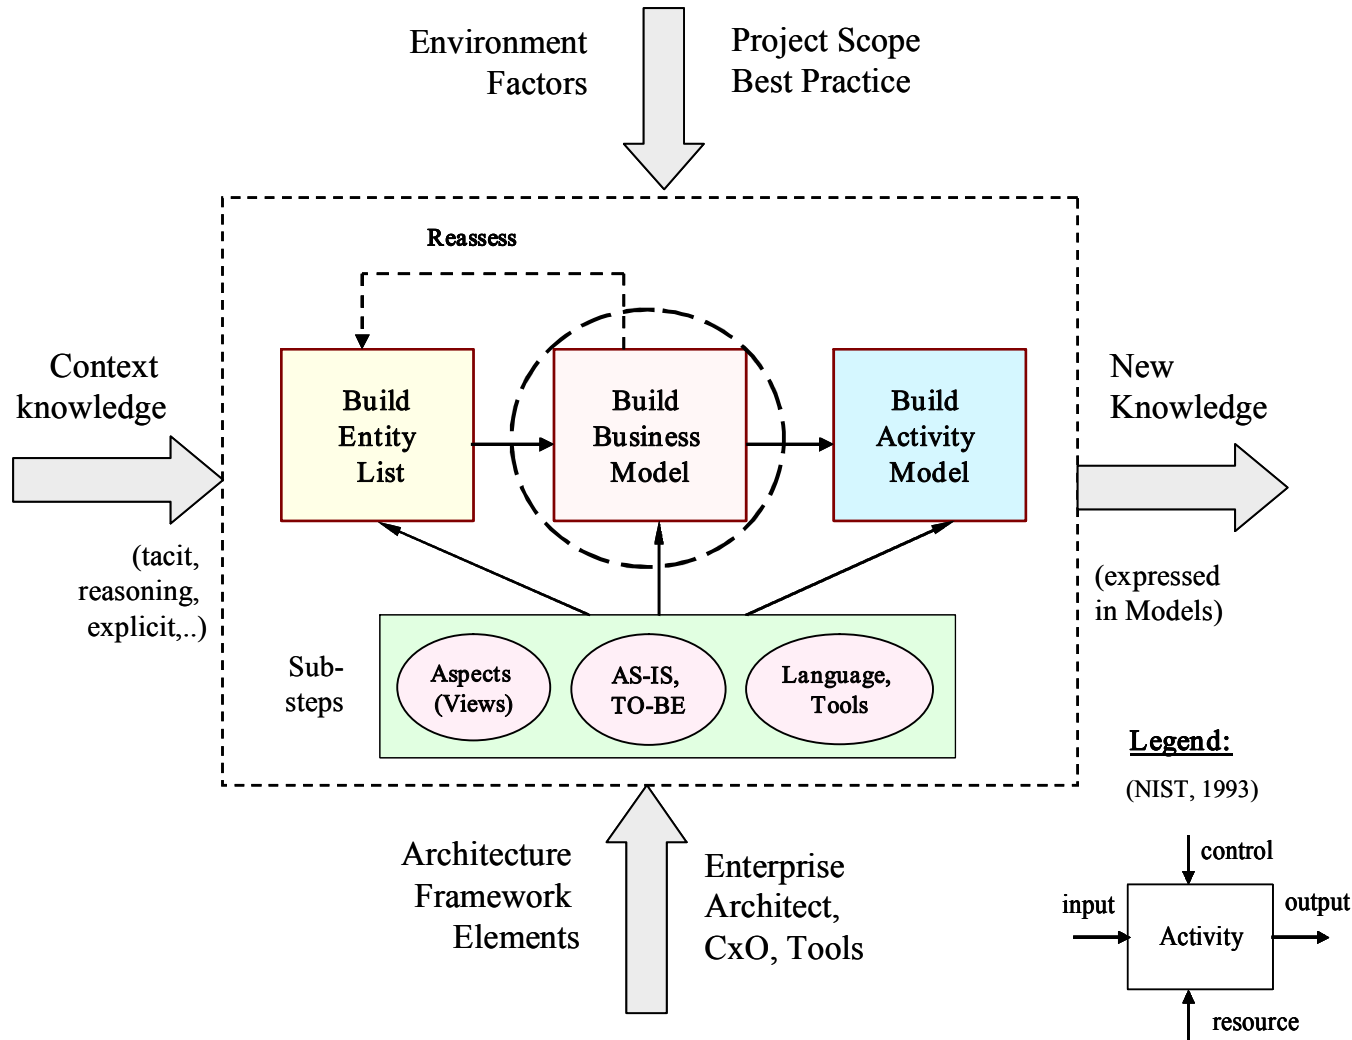

The Architecture Framework: ISO 15704:2000 Annex A (GERAM)

The Modelling Framework of GERA

The Meta-methodology (to be applied to the EM aspect)

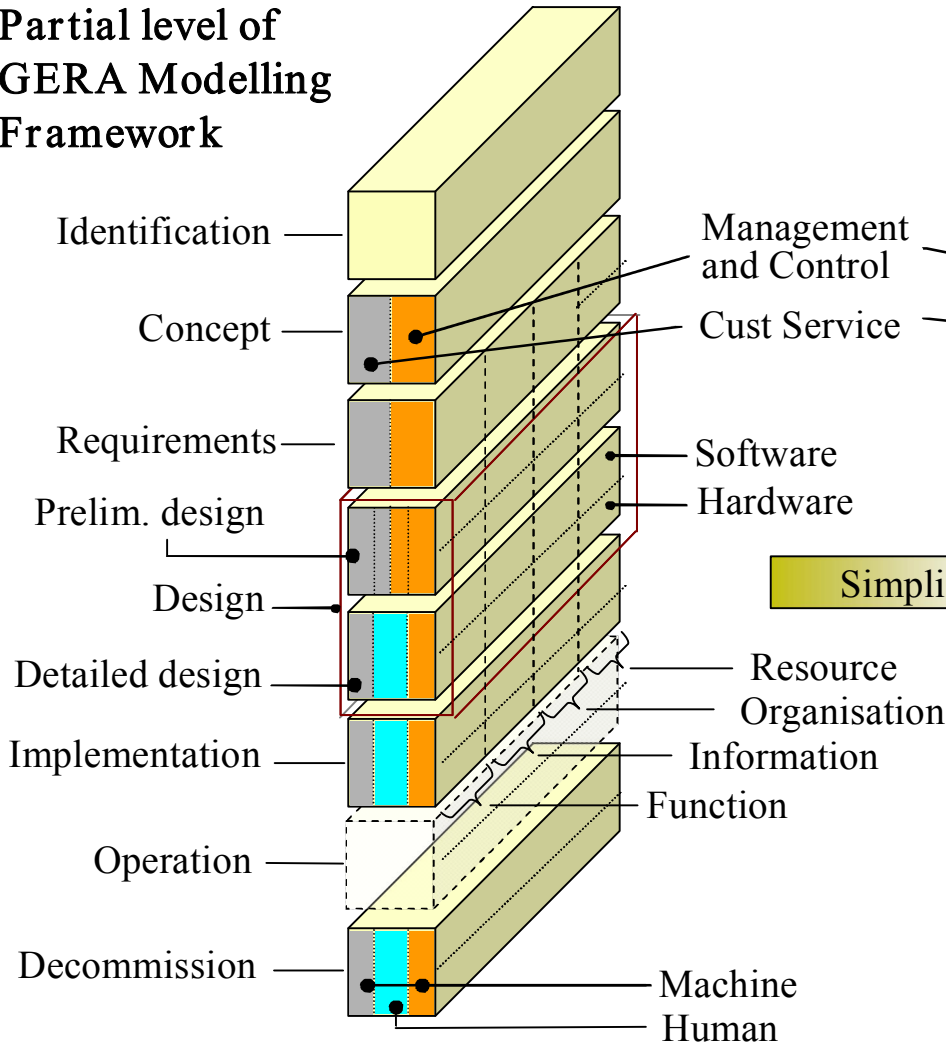

Can be easily customised for the EM (and many other) aspect(s)

(Noran, 2009)

Sample Step Two: preparing the business model

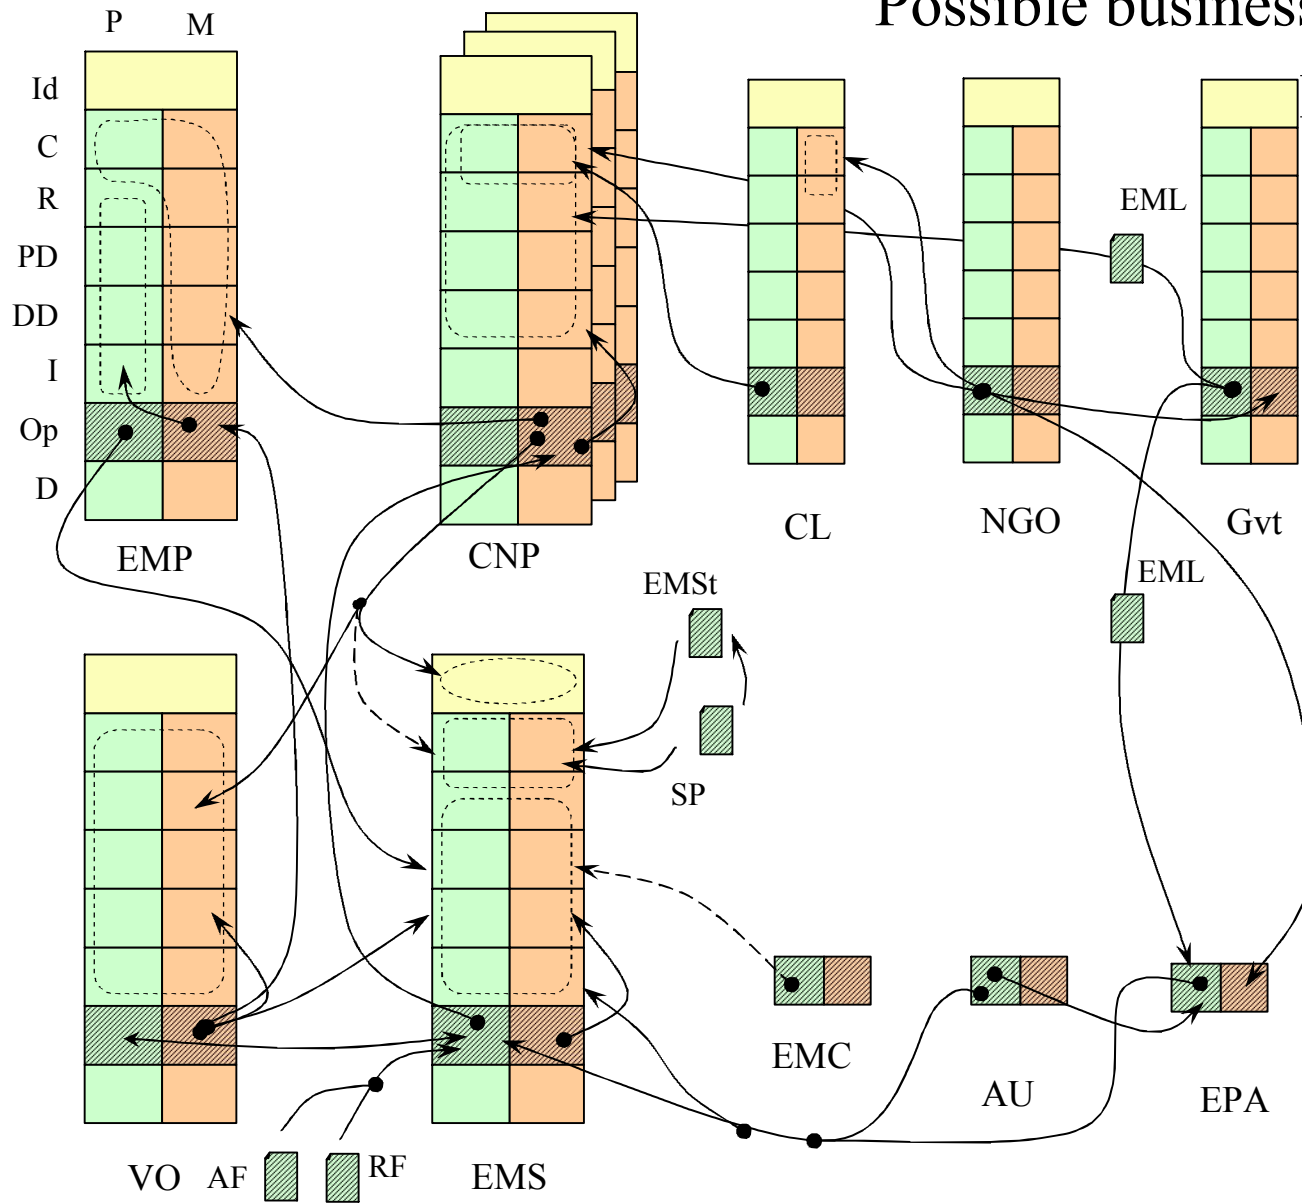

Partial level of
GERA Modelling
Framework

Formalism used
in the Business Model

	P	M	
			Id

			D

Possible business (network) model of EMS / EMP creation and operation

EMS / EMP creation and operation

Legend:

- CNP: CNO Participants;
- EMS: Env. Mgmt System
- EMP: Env. Mgmt Project
- EML: Env. Mgmt Laws
- EMSt: Env. Mgmt Standards
- EMC: Env. Mgmt Consultants;
- EPA: Env. Protection Agency
- NGO: Non-Gov't Organisation
- VO: VO set up by CNO
- AF: Assessment Framework
- RF: Reporting Framework
- SP: Sustainability Principles
- Gvt: Government
- AU: Auditor
- CL: Client
-  : Op. phase-Prod & Mgmt
-  : Op. Phase-Prod. only

Life cycle phases: Id: Identification; C=concept; R=requirements, PD=preliminary design DD=detailed design, I=implementation, Op=operation, D=decommissioning

Other aspects: P=Production / Service, M=management

 : Possible scenario

Some Notes regarding the Business Model:

- The arrows represent ‘influences’ of the various entities on one or more life cycle phases of other entities
- Some life cycle diagrams have been collapsed to represent only relevant phases
- The influences can be thought of *stakeholder concerns* translating into changes in the ‘influenced’ (target) entity/ies
- The model represents a combined AS-IS / TO-BE state.
- The model helps common understanding, building consensus and thus buy-in of the stakeholders.

Step Two (cont): Modelling the Decisional Aspect: GRAI Grid

(generic example showing a potential problem)

Legend: = decisional centre (DC); \Rightarrow = decisional framework (DF); $\bullet \rightarrow$ = information flow (IF)
 = role; \dashrightarrow = DFs showing turbulence; \Rightarrow = DFs showing good design

(Doumeingts et al, 1998)

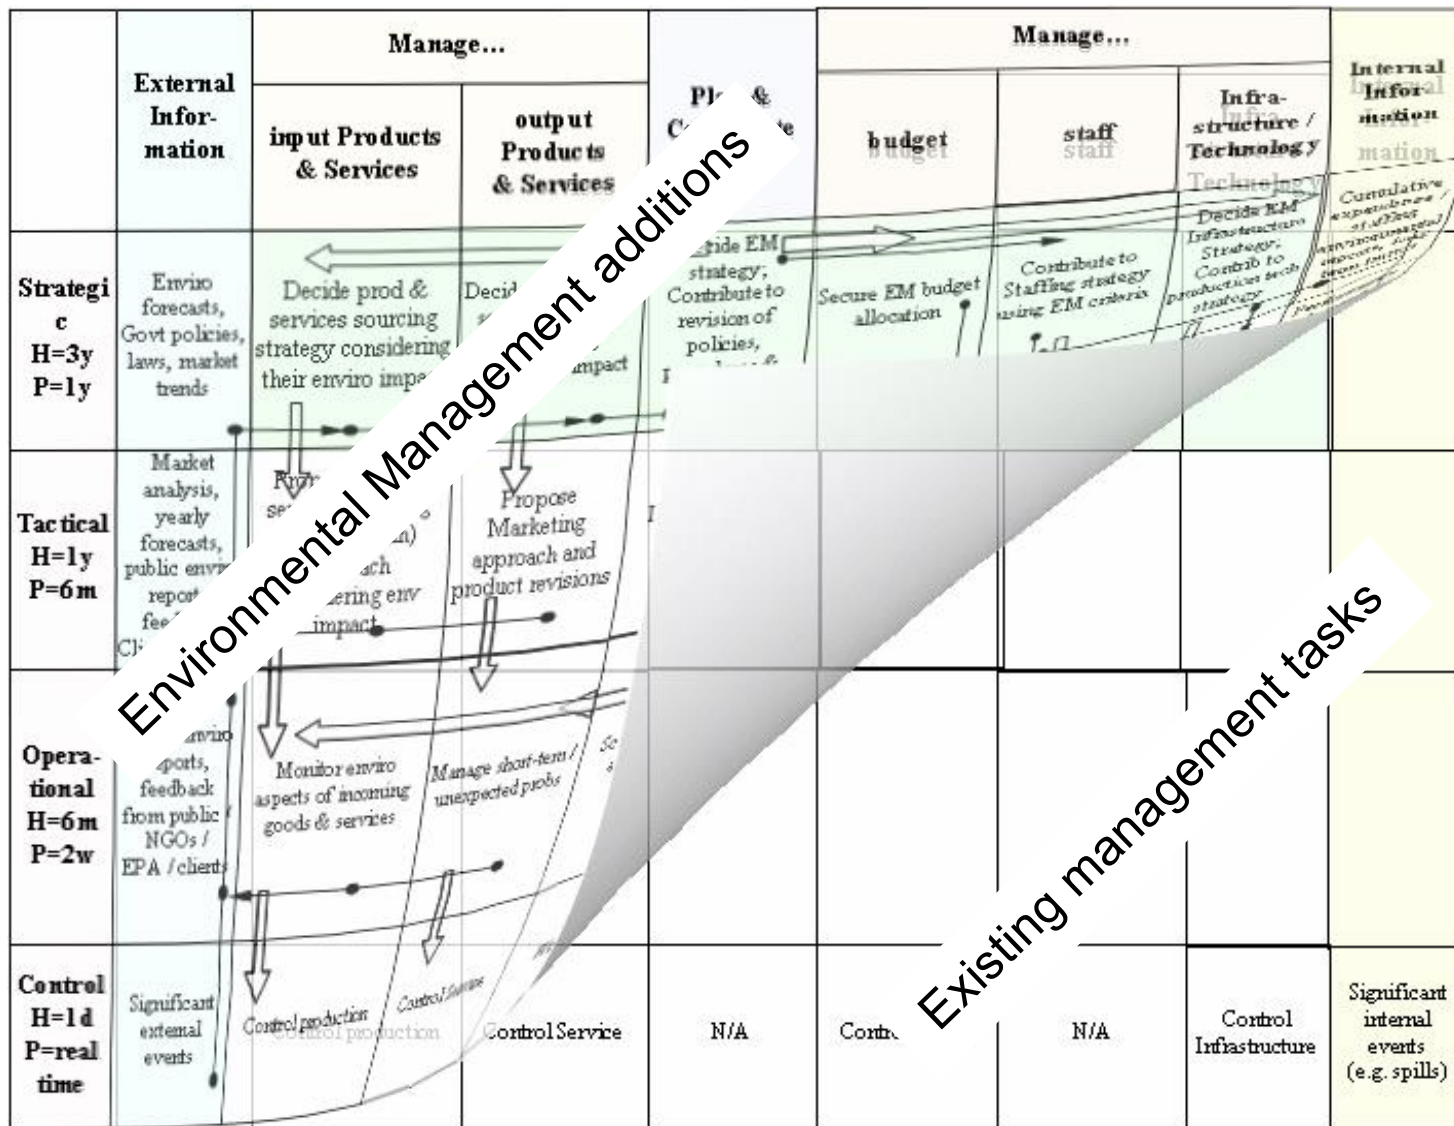

A Possible Decisional Model for the EM Project / EMS

	External Information	Manage...		Plan & Coordinate	Manage...			Internal Information
		Input Products & Services	Output Products & Services		Budget	Staff	Infrastructure / Technology	
Strategic H=3y P=1y	Enviro forecasts, Govt policies, laws, market trends	Decide prod & services sourcing strategy considering their enviro impact	Decide new prod & services strategy considering their enviro impact	Decide EM strategy; Contribute to revision of policies, procedures & processes	Secure EM budget allocation	Contribute to Staffing strategy using EM criteria	Decide EM Infrastructure Strategy; Contribute to production tech strategy	Cumulative expenditure / staffing environmental reports, long term trends
Tactical H=1y P=6m	Market analysis, yearly forecasts, public enviro reports, feedback, Client profiles	Propose prod & services sourcing (supply chain) approach considering env impact	Propose Marketing approach and product revisions	Decide yearly EM plan	Distribute allocated EM budget	Contribute to hiring, staff development & promotion using EM principles	Manage Renewal of EM infrastructure; Evaluate production technology	Performance evals, product / environmental reports, expenditure, int enviro audits
Operational H=6m P=2w	Public enviro reports, feedback from public, NGOs / EPA / clients	Monitor enviro aspects of incoming goods & services	Manage short-term unexpected probs	Schedule EM activities	Manage unexpected EM savings / expenses	Manage unexpected staff issues (e.g. unavailability, surge in demand)	Maintain EM infrastructure, Monitor Production Technology's EM performance	enviro feedback, events
Control H=1d P=real time	Significant external events	Control production	Control Service	N/A	Control budget	N/A	Control Infrastructure	Significant internal events (e.g. spills)

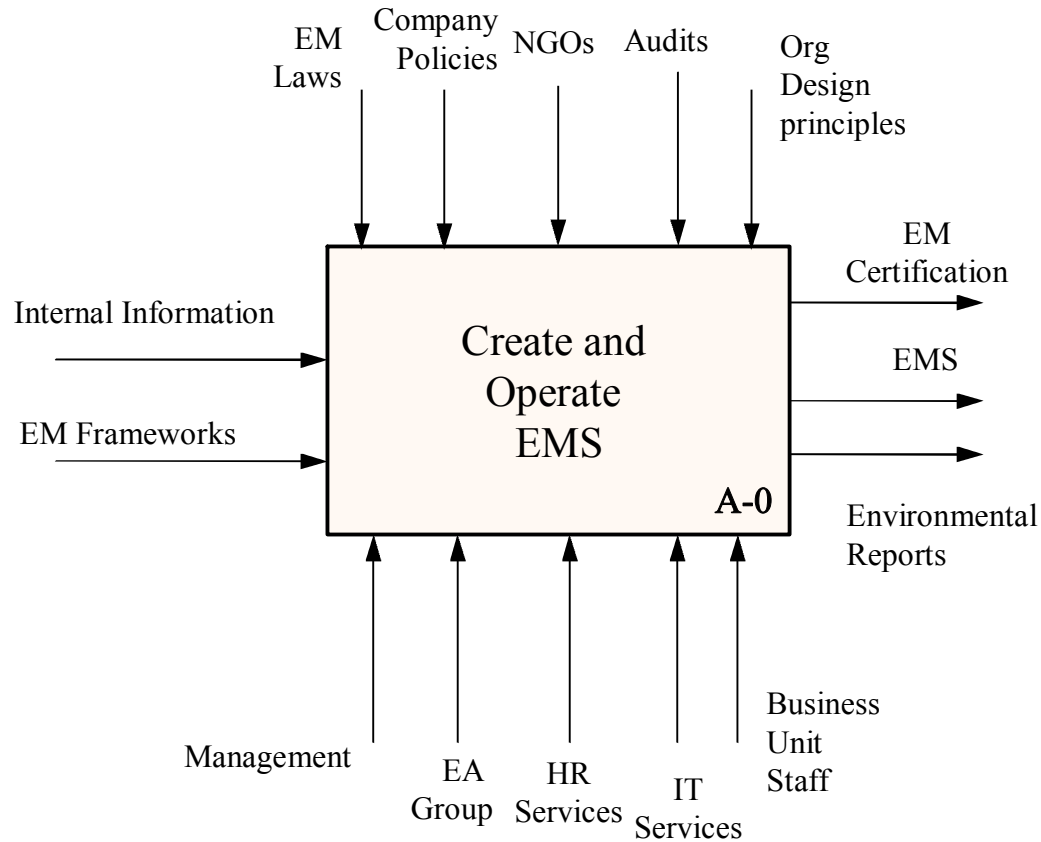

⇒ = decisional framework (DF); ●→ = info. link (IL); - - - = Enviro manager / Board; - - - - = EMS auditor

H = horizon; P = period

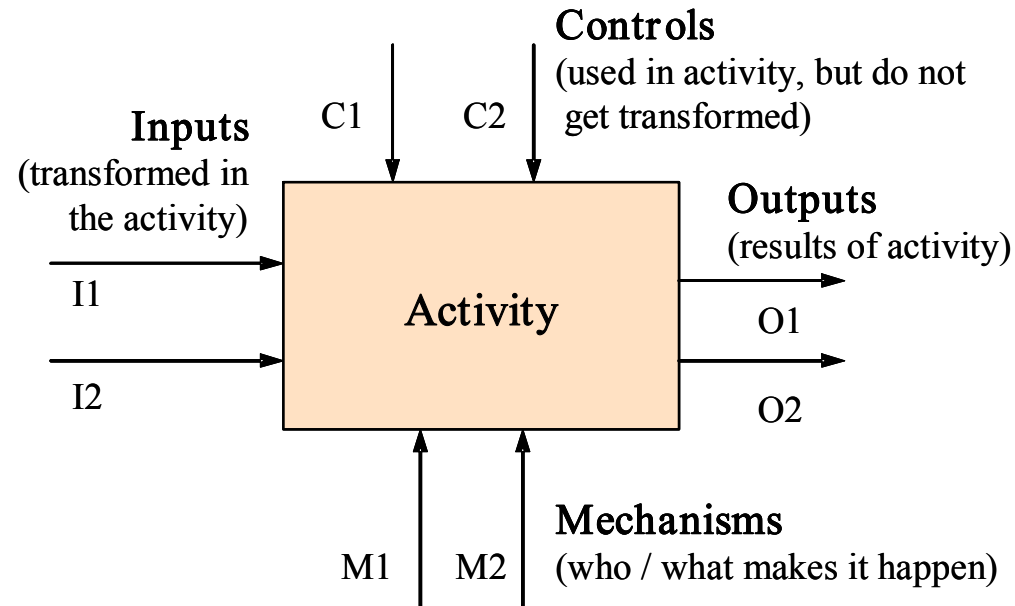

Superimposing EM Decisional Model on the existing Management Model

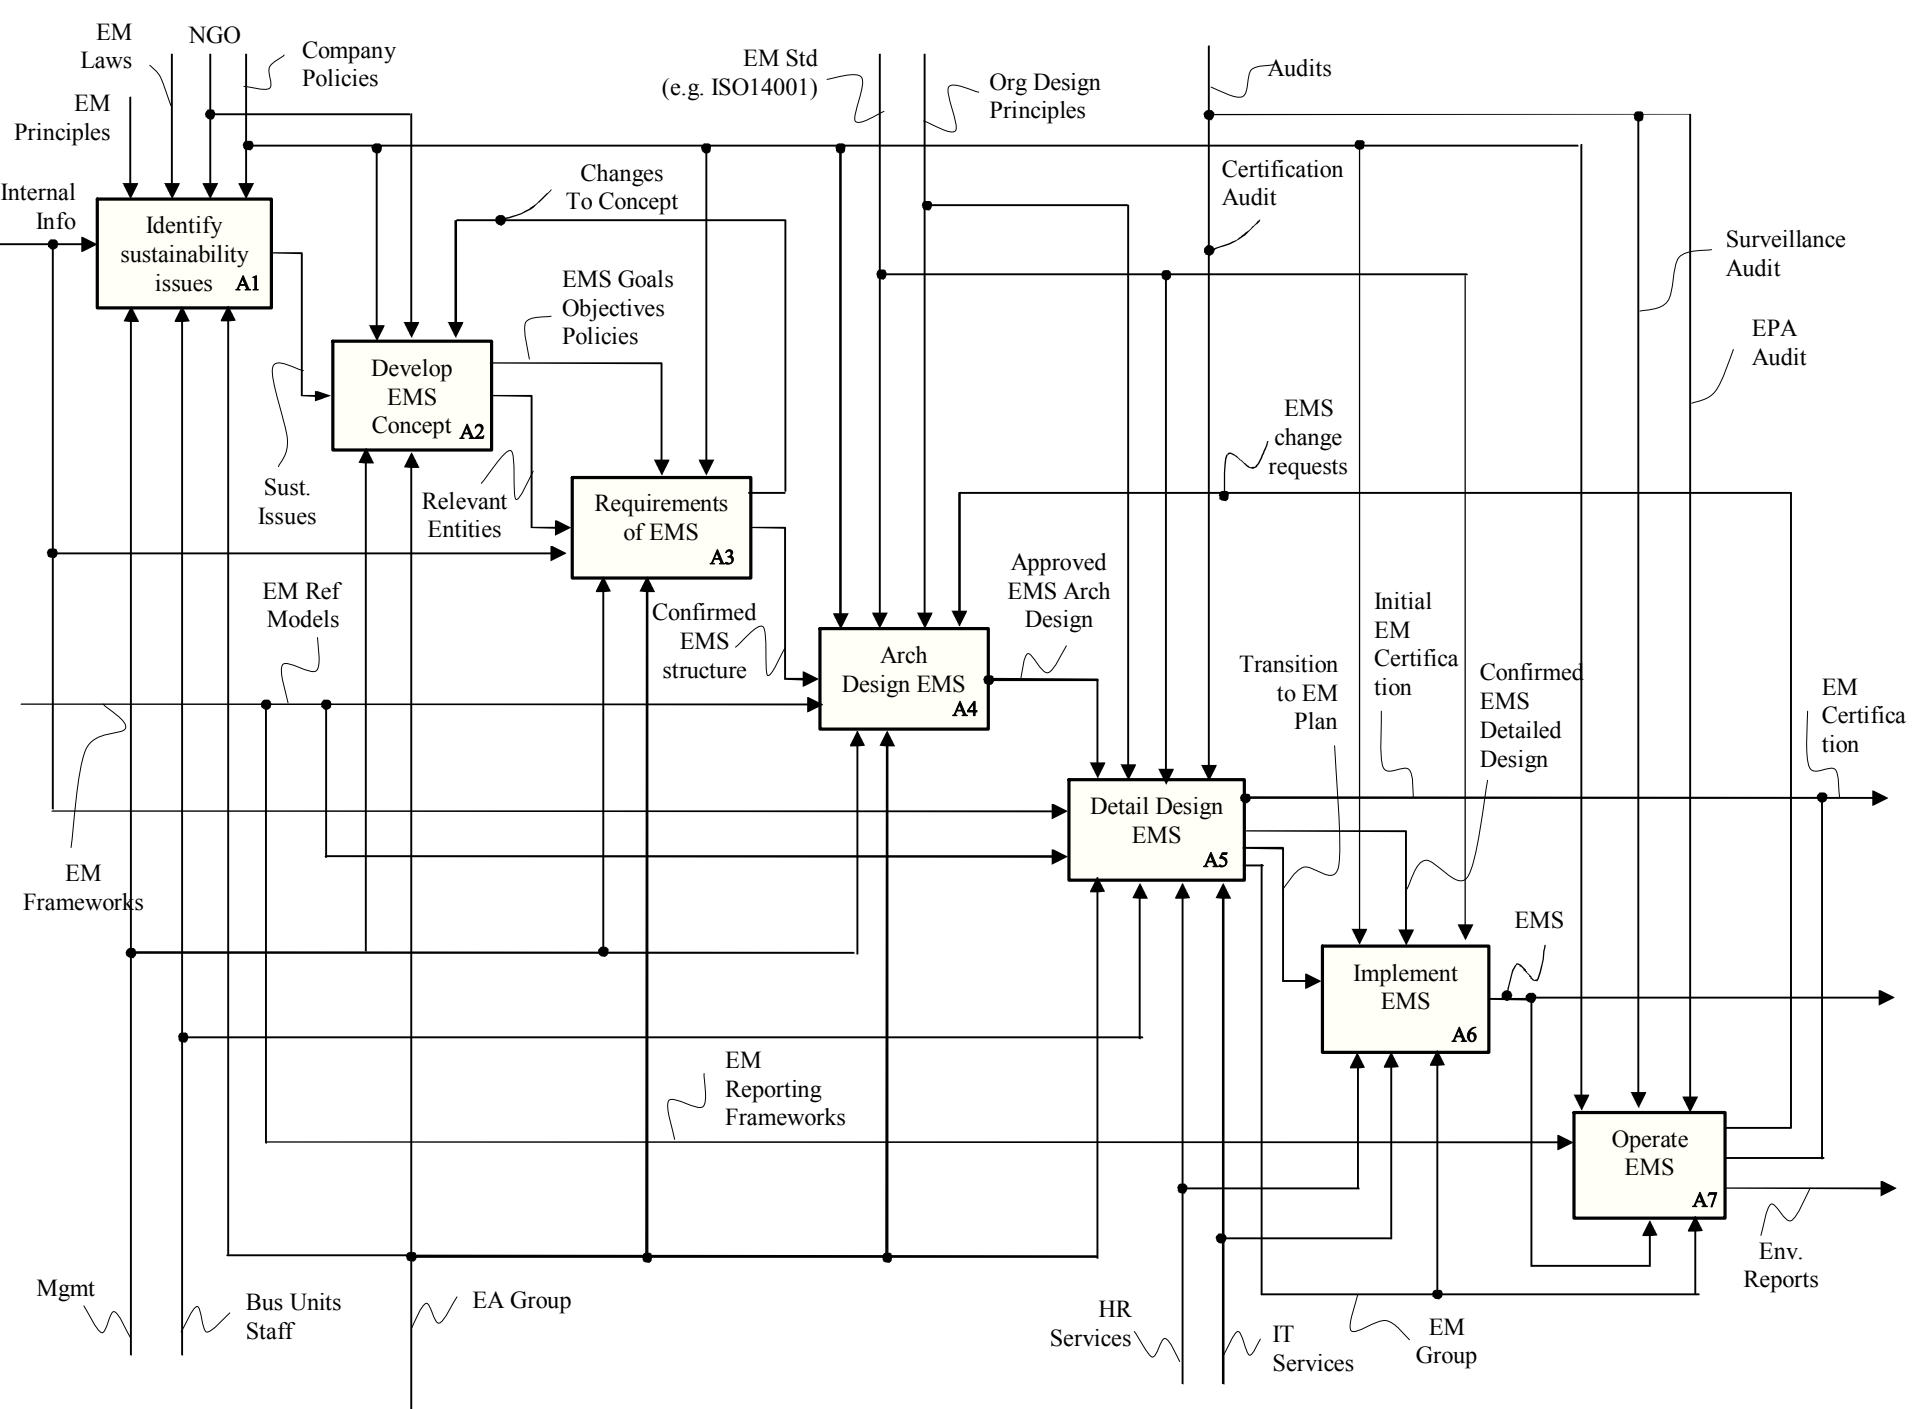

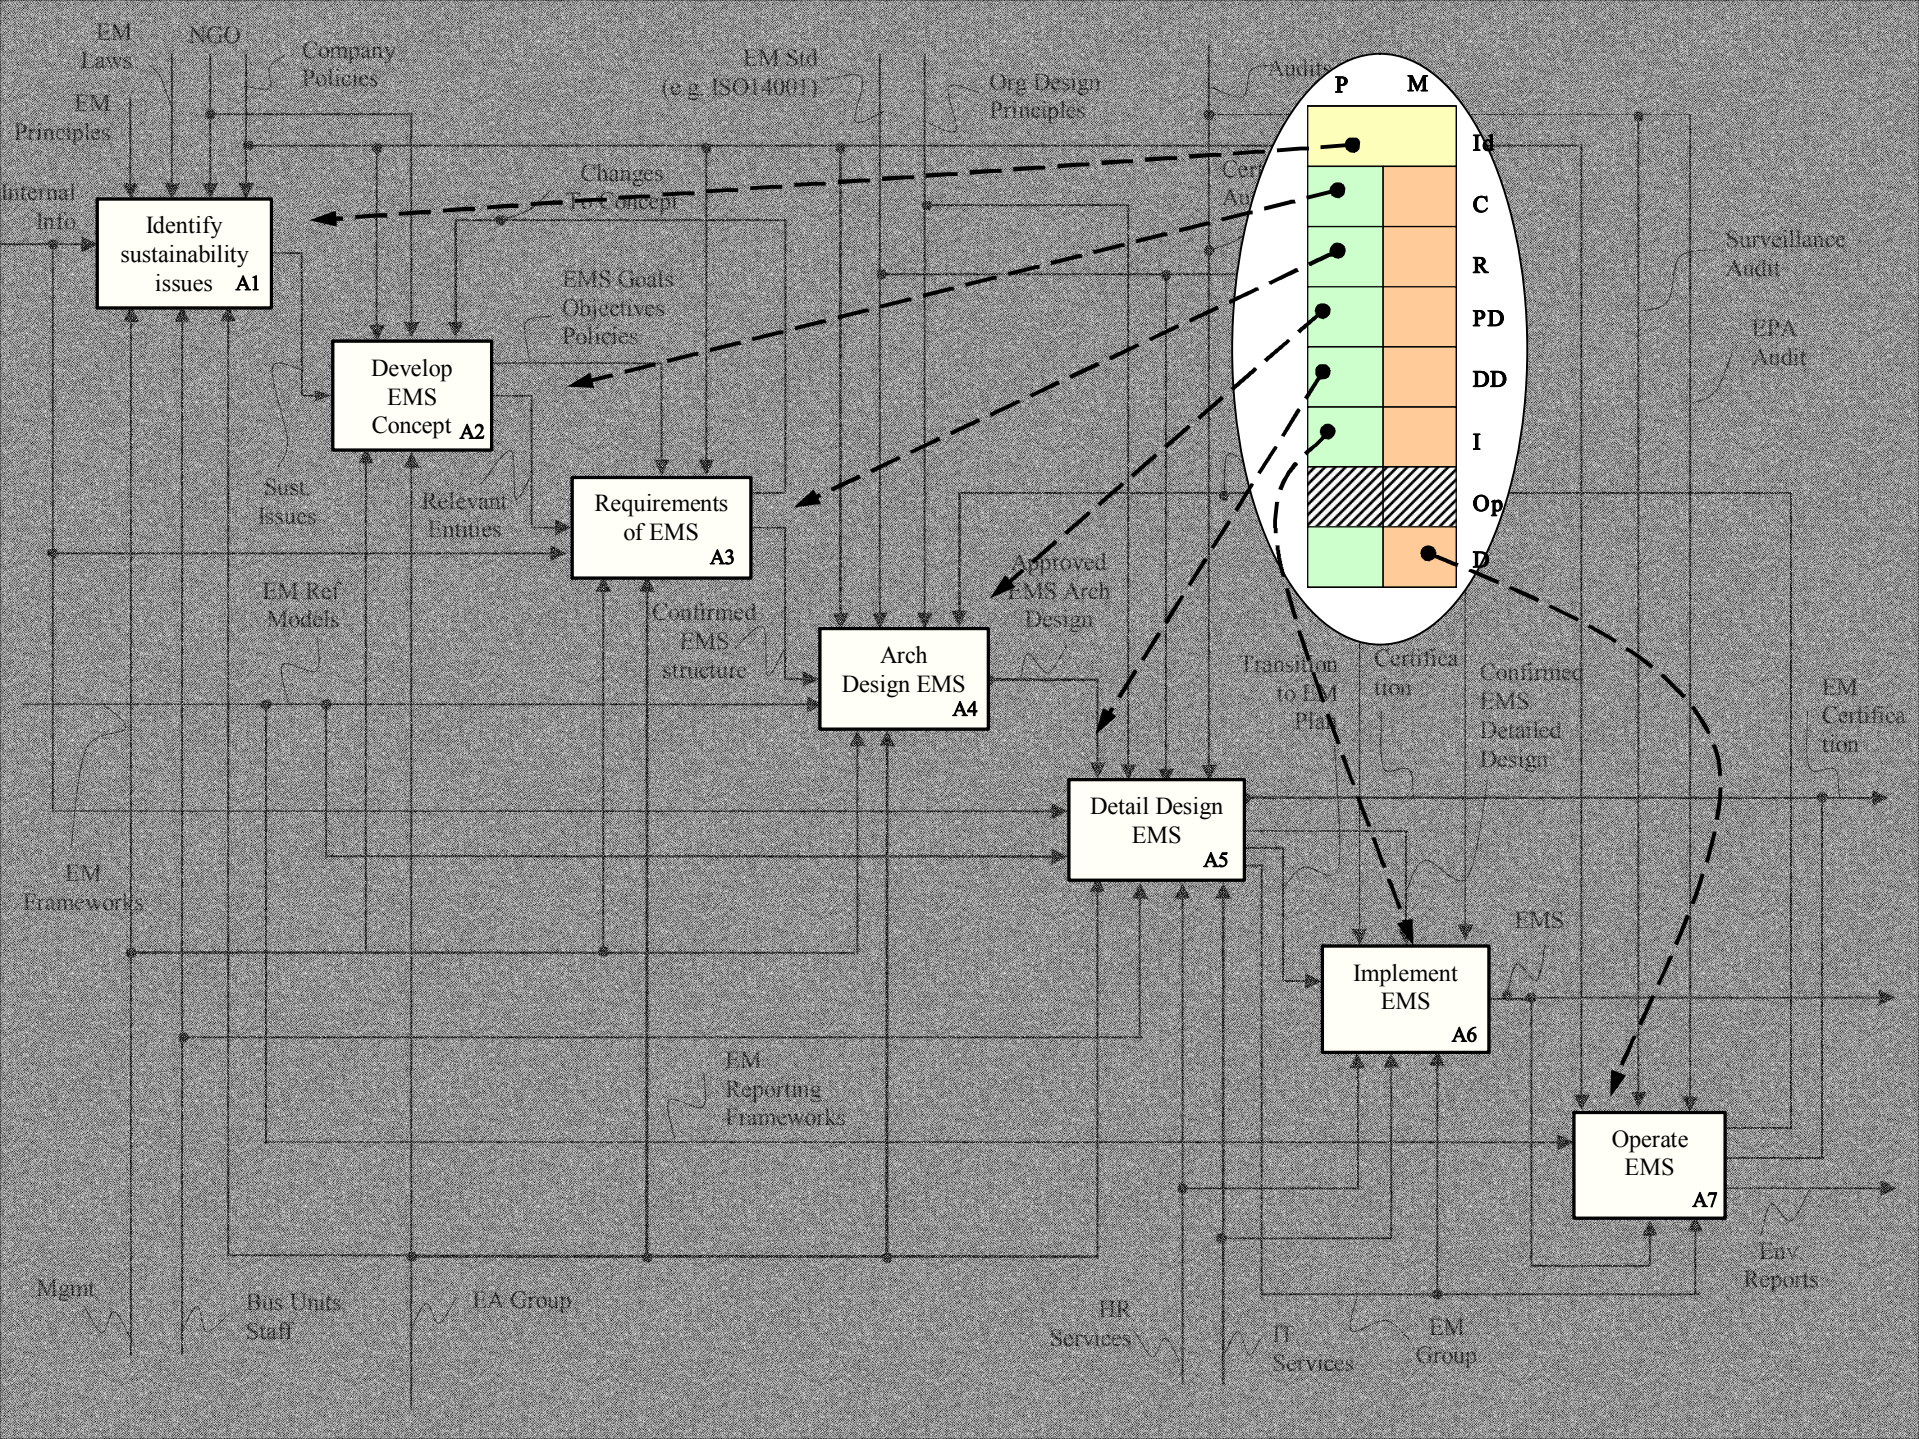

Sample Step Three: generating the step-by-step method

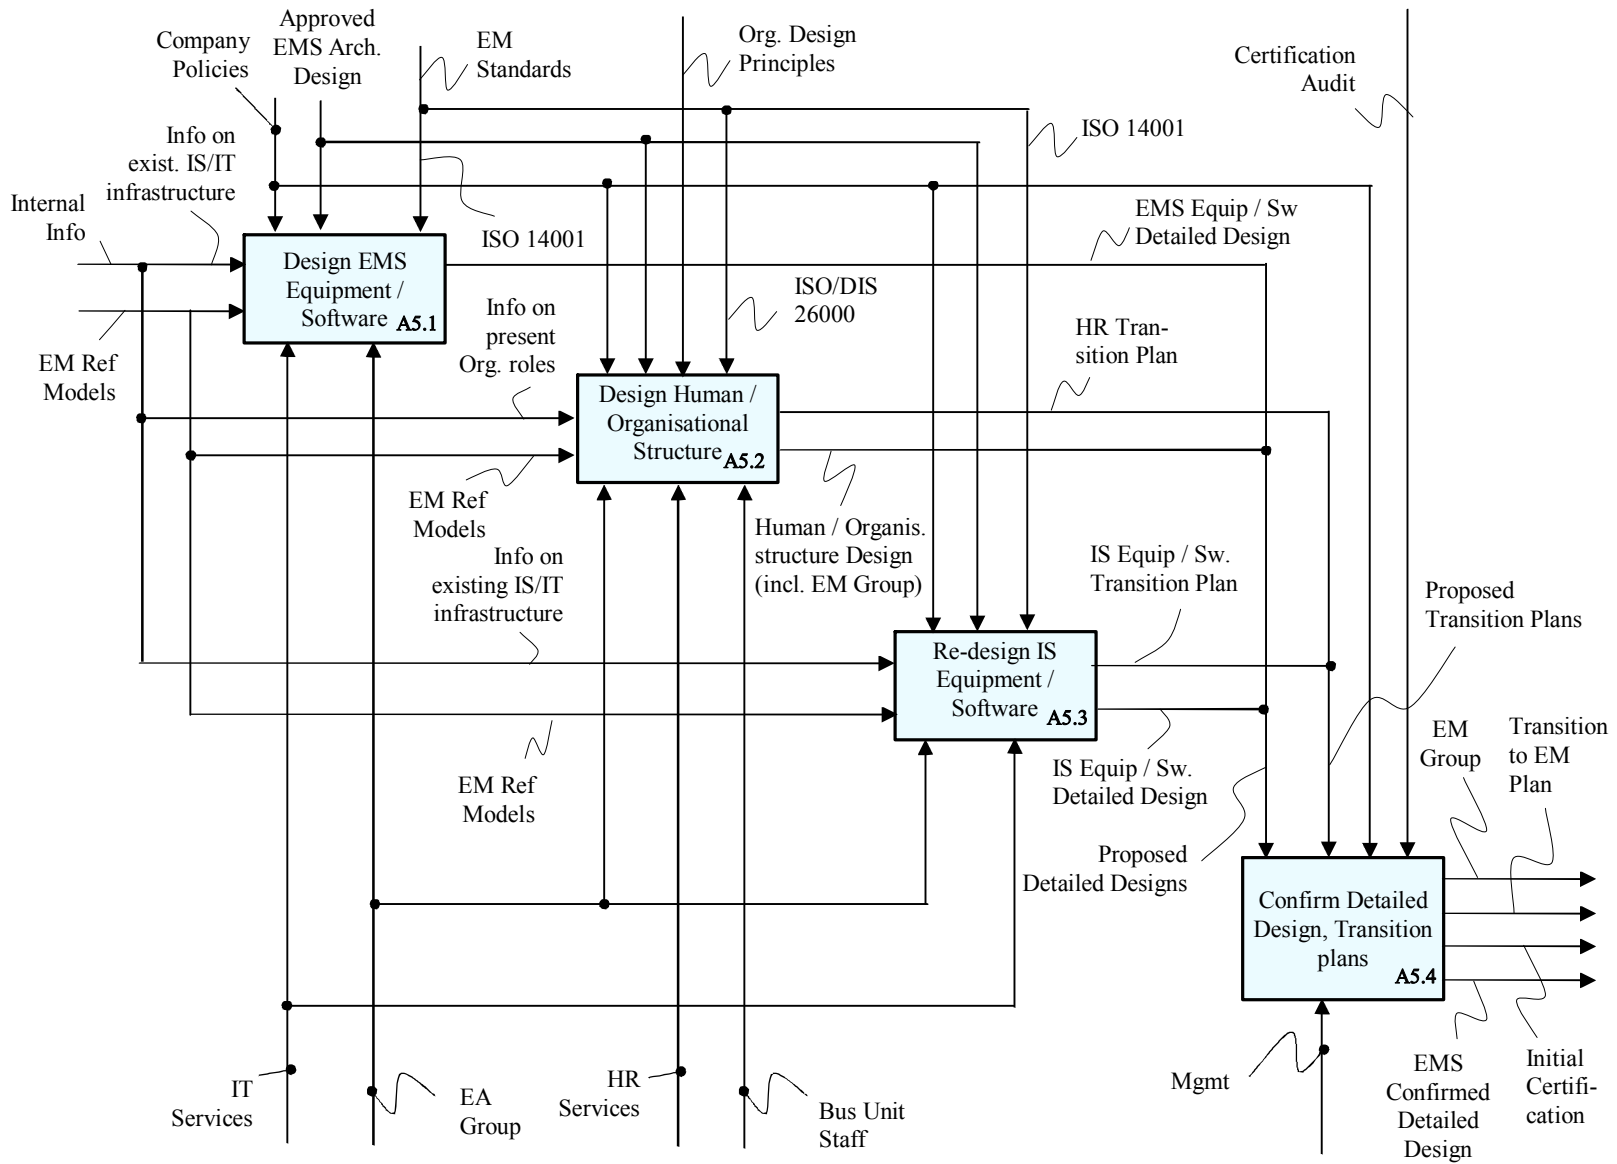

Modelling the Functional Aspect: IDEF0

Conclusions

The use of an EA approach in the EM project brings benefits such as:

- All relevant entities participating in an EM project are taken into account, whether inside / outside the CN and/or the CN participants themselves (e.g. business units)
- The relations between these participants are considered in the context of their life cycles; combined with other relevant aspects they will infer new valuable information
- Provision of repository/ies of potentially useful modelling frameworks / aspects and method(s) to select these

Thus it appears that EA can provide the necessary artefacts / prerequisites for a coherent, cross-departmental/participant and culture-changing approach to EM
