

The Application of Incentive Mechanisms for the Participation of Enterprises in Collaborative Networks from an economic Perspective

Agenda

- Motivation
- 2. Incentives in an Economic Environment
- 3. Insufficient Production Capacity
- 4. Lacking Financial Rewarding of an Order
- 5. A Framework-related Approach
- 6. Conclusions

- 1. Motivation
- 2. Incentives
- 3. Production Capacity

5. Framework-related Approach

6. Conclusions

Collaborative Network Management: The EVCM*-Approach

Objectives (selection)

*"Extended Value Chain Management"

- central management instance of the network
- equal rights for all participants
- permanent satisfaction of costumers is aimed
- identification of customer oriented best solutions (price, delivery date) for sustainable success

Functions (selection)

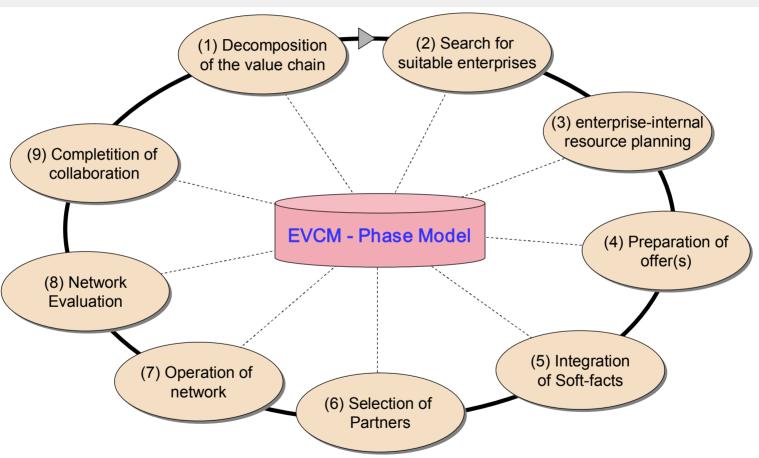

- supply of suitable methods for the configuration and operation of SME-based collaborative production networks ... "Phase Model"
- partner selection under consideration of hard- and soft-facts
- allocation of income / profit and comprehensive performance analysis

No. 2 PRO-VE 2010 St. Etienne, France

- 1. Motivation
- 2. Incentives
- 3. Production Capacity

- 4. Financial rewarding
- 5. Framework-related Approach
- 6. Conclusions

Process Organisation: The EVCM-Phase Model

process organization / workflow management

→ typical phases of the life cycle of a collaborative production network

No. 3 PRO-VE 2010 St. Etienne, France

- 1. Motivation
 - 2. Incentives
- 3. Production Capacity

- 4. Financial rewarding
- 5. Framework-related Approach
- 6. Conclusions

Theoretic Economic Framework

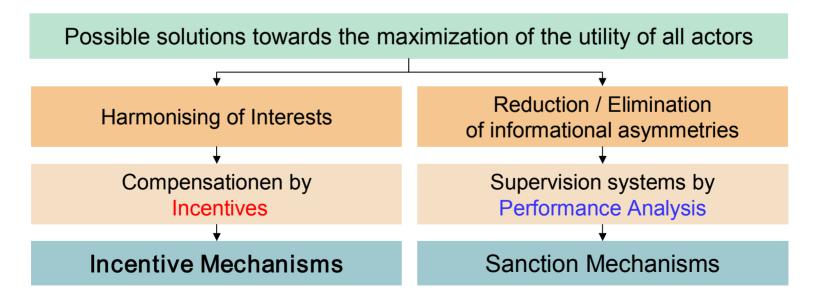

Behaviour Assumptions of the New Institutional Economics

- individual maximization of utility
- marviada maximization of atility
- opportunistic behavior

- bounded rationality
- asymmetrical distribution of information

Problem: actors (enterprises) take advantage of the actual situation

Objective: maximization of the utility of <u>all</u> actors (participating enterprises)

No. 4 PRO-VE 2010 St. Etienne, France

- 1. Motivation
 - 2. Incentives
- 3. Production Capacity

- 4. Financial rewarding
- 5. Framework-related Approach
- 6. Conclusions

Methodology and Objective(s)

- a fair allocation of income / profit
- integration of incentive and sanction mechanisms
- development of models
- combination of approaches
- application in praxis
- sustainable success

Incentive Mechanisms

Harmonizing of Interests

Basic Models for the allocation of income

Sanction Mechanisms

Performance Analysis

Model for the allocation of income / profit in collaborative production networks

No. 5 PRO-VE 2010 St. Etienne, France

- 1. Motivation
 - 2. Incentives
- 3. Production Capacity

5. Framework-related Approach

6. Conclusions

Incentive Mechanisms

Functions

activation: stimulation of motivation and cognitive abilities

controlling: influence of the agent's behaviour

information: agents get signals regarding desirable behaviour

selection: principals get information about agents' performance

coordination: coordination of single sections of agents

Requirements

- economically justifiable
- incentives must be lower (or at least equal) to the expected profit
- considering the correct receiver
- payment of the correct amount (quantification of incentive)
- considering side-effects
- transparency
- performance oriented

No. 6 PRO-VE 2010 St. Etienne, France

- 1. Motivation
- 2. Incentives
 3. Production Capacit

- 4. Financial rewarding
- 5. Framework-related Approach
- 6. Conclusions

Incentive mechanisms

Different initial situations, for example:

Incentives in case production capacity is not sufficient

- production capacity is not available according to the demand
- no offers by requested enterprises
- possibilities for the supply of necessary capacities

Incentives in case of a lacking financial attractiveness

- an enterprise is not willing to participate
- core competence is available in the static network
- attempt to convince (utility of net vs. utility of enterprise)

No. 7 PRO-VE 2010 St. Etienne, France

- 1. Motivation
- 2. Incentives
- Production Capacity

- 4. Financial rewarding
- 5. Framework-related Approach
- 6. Conclusions

Incentive mechanisms I: Insufficient Production Capacity

Incentives in case production capacity is not sufficient

- non-participation of an enterprise (maximization of utility)
- required production capacity is not available / sufficient according to the demand
- no offer by requested enterprise is released
- (but) enterprise is the only to offer requested core competence
- suitable incentives for the "missing" enterprise need to be identified
- → problem: quantification of incentive payments
- → solution: searching for a suitable approach

No. 8 PRO-VE 2010 St. Etienne, France

- 1. Motivation
- 2. Incentives
- 3. Production Capacity

5. Framework-related Approach

6. Conclusions

Incentive mechanisms II: Insufficient Financial rewarding

Incentives in case of a lacking financial rewarding

- an enterprise is not willing to participate
- reason: lacking financial rewarding (profit)
- process of determination of profit (preparation of the offer)
- core competence is available in the static network
- sufficient production capacities
- attempt to convince "missing" enterprise (utility of network vs. utility of enterprise)
- precondition: considering the consequences
- incentive payments according to the situation
- guaranteed profit share is not accepted
- quantification of expected profit share
- difference complies the necessary incentive payment
- granted amount depends on the approach for profit distribution

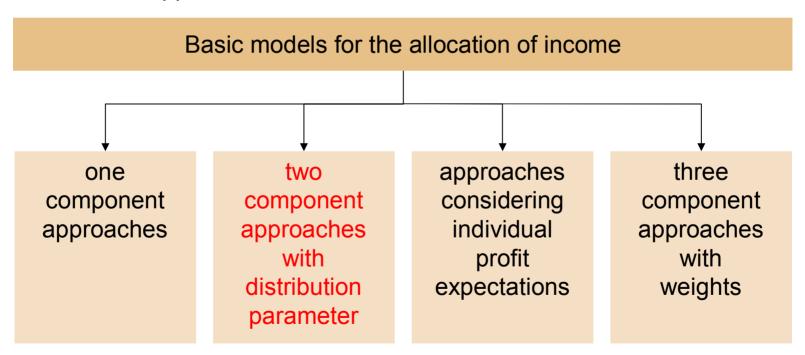

No. 9 PRO-VE 2010 St. Etienne, France

- 1. Motivation
 - 2. Incentives
- 3. Production Capacity

- 4. Financial rewarding
- 5. Framework-related Approach
- 6. Conclusions

Different approaches for income allocation

- different influence factors and different situations
- → different approaches for the allocation of income

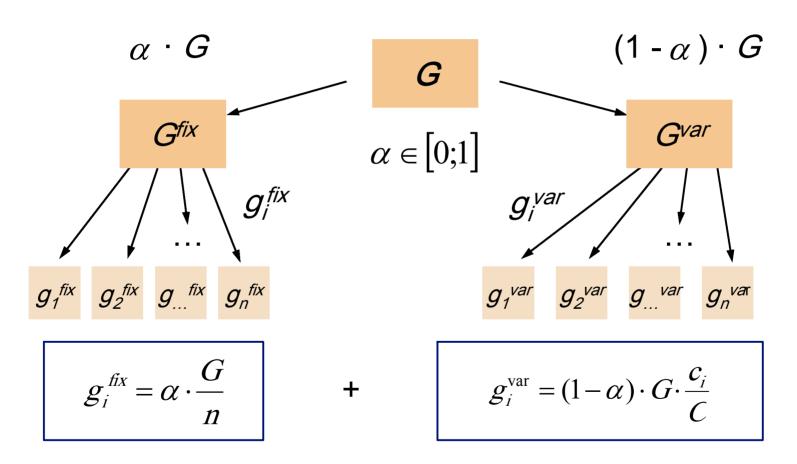

Special scenario: allocation of losses

No. 10 PRO-VE 2010 St. Etienne, France

- 1. Motivation
- 2. Incentives
- 3. Production Capacity

- I. Financial rewarding
- 5. Framework-related Approach
- 6. Conclusions

Two-component approaches with a distribution parameter

lpha : weights the profit distribution according to the share which is distributed fixed and variable

No. 11 PRO-VE 2010 St. Etienne, France

- 1. Motivation
- 2. Incentives
- 3. Production Capacity

5. Framework-related Approach

6. Conclusions

Assumptions

Calculation of individual profit shares

Basis: comprehensive calculation approach

- a. incentive payment is integrated into allocation of income
- b. profit share is based on a fixed and a variable share (see page before)
- c. all incentive and profit payments are financed from the total profit of a value-added process
- d. agreements considering a minimum guaranteed profit share allow a comprehensive calculation approach
- → minimum profit share consist of regular profit share and incentive payment, incentives are financed by all network members

- 1. Motivation
- 2. Incentives
- 3. Production Capacity

5. Framework-related Approach

6. Conclusions

Modeling / Conditions

Calculation of individual profit shares

Basis: comprehensive calculation approach considering a finite number of enterprises in collaboration while only one receives an incentive payment

there are some conditions to consider:

(1) sum of profit shares is total of profit less incentives granted

$$\sum_{i=1}^{n} g_i = G - \sum_{j=1}^{n} a_i$$

(2) two-component approach for profit distribution

$$g_i = \alpha \cdot \frac{\sum_{j=1}^{n} g_i}{n} + (1 - \alpha) \cdot \frac{c_i}{\sum_{j=1}^{n} c_i} \cdot \sum_{j=1}^{n} g_i$$

- (3) consideration of a minimum guaranteed profit share
- (4) condition concerning slack variable and incentives
- → 4 equations and 3 variables to calculate: *ai*, *gi*, *ui*

$$g_i^{min} = g_i + a_i - u_i$$
$$a_i \cdot u_i = 0$$

- 1. Motivation
- 2. Incentives
- 3. Production Capacity

- 4. Financial rewarding
- Framework-related Approach
- 6. Conclusions

Example

3 enterprises in a collaborative network

→ 5 variables to calculate:

(1)
$$\sum_{i=1}^{n} g_i = G - a_1$$

(2)
$$g_1 = \alpha \cdot \frac{\sum_{j=1}^{n} g_i}{n} + (1-\alpha) \cdot \frac{c_1}{\sum_{j=1}^{n} c_i} \cdot \sum_{j=1}^{n} g_i$$

(3)
$$g_2 = \alpha \cdot \frac{\sum_{j=1}^n g_i}{n} + (1-\alpha) \cdot \frac{c_2}{\sum_{i=1}^n c_i} \cdot \sum_{j=1}^n g_i$$

(4)
$$g_3 = \alpha \cdot \frac{\sum_{j=1}^n g_i}{n} + (1-\alpha) \cdot \frac{c_3}{\sum_{j=1}^n c_i} \cdot \sum_{j=1}^n g_i$$

$$(5) \quad g_1^{min} = g_1 + a_1 - u_1$$

(6)
$$a_1 \cdot u_1 = 0$$

- 1. Motivation
- 2. Incentives
- 3. Production Capacity

Framework-related Approach

6. Conclusions

Example

Result (after several calculation steps)

→ equation for the calculation of the incentive

$$a_1 = \frac{G \cdot \left(\frac{\alpha}{n} + (1 - \alpha) \cdot \frac{c_1}{\sum\limits_{j=1}^{n} c_i}\right) - g_1^{min}}{\frac{\alpha}{n} + (1 - \alpha) \cdot \frac{c_1}{\sum\limits_{j=1}^{n} c_i} - 1}$$

Basis: only enterprise one is an incentive payment granted

In case of more enterprises in the network the number of equations rises.

The model gets more complex but is still solvable.

- 1. Motivation
- 2. Incentives
- 3. Production Capacity

5. Framework-related Approach

6. Conclusions

Conclusions

Problems to be solved:

- distribution of loss
- decision support for profit distribution approaches
- calculation of distribution parameter α
- incentive mechanisms
- extended modeling of evaluation functions
- contribution to sustainable success

Future works:

- empirical research
- validation of assumptions
- information-technical implementation
- practical application
